Contents

Course Information	1-1
Prerequisites	1-2
Description	1-2
Objectives	1-3
Agenda	1-6
Umbrella Curriculum	1-11
Class Setup Procedures	1-12
Logon Assignments	1-12
Change Control Number Assignment.....	1-13
Hogan Systems Overview	2-1
Topics	2-1
Objectives	2-2
Introduction to Hogan Systems	2-3
Hogan Systems	2-3
Tower of Software	2-6
Financial Support Systems (FSS)	2-7
Umbrella Application Development Support Systems.....	2-8
Change Control/Release Control Systems (CCS/RCS)	2-9
Process Control Data (PCD)	2-9
Function Processing System (FPS).....	2-9
Scheduled Processing System (SPS)	2-9
Date Services (DTS)	2-9
Condition Code Processing (CCP)	2-10
Edit and Format System (EFS)	2-10
Document Printing System (DPS)	2-10
Data Gathering System (DGS)	2-10
Process Environment Manager (PEM).....	2-11
Physical vs. Logical Environment	2-12
Process Dictionary	2-13
The Big Picture	2-15
The Umbrella	3-1
Purpose	3-1
Topics	3-2
Objectives	3-2
Umbrella Main Menu	3-3
Umbrella Menu Hierarchy	3-4
Process Dictionary Hierarchy.....	3-5
Process Dictionary Main Menu	3-6
Transactions	3-7
Umbrella Transactions and Commands	3-8
UMB—Transaction	3-8
UMBR—Transaction	3-8
Command, Owner, and CC#	3-8
Umbrella Direct Prompts	3-8
Umbrella Jump Facility	3-8

Umbrella Standard CDMF/PCD Processing PF Key Assignments.....	3-10
System Transactions	3-11
Menu of All Menus—MUAL.....	3-11
Set Defaults—UDFL	3-12
Set Effective Date—UDAT	3-14
Set Company—UCOM.....	3-15
Umbrella Screens Exercise	3-16
Summary	3-18
COBOL Under the Umbrella	4-1
Purpose	4-1
Topic	4-2
Objective	4-3
Standard COBOL Vs. Hogan COBOL	4-4
Example Hogan COBOL Program	4-6
Summary	4-8
Change Control System - CCS	5-1
Purpose	5-1
Topics	5-2
Objectives	5-3
Change Control System	5-4
Online Maintenance	5-5
Change Control Master.....	5-6
Change Control Detail	5-6
Change Control Inquiry/Maintenance	5-6
Change Control BASE Screen	5-7
Change Control PROBLEM Screen—PF10	5-7
Change Control RESOLUTION Screen—PF 7	5-8
Change Control DETAIL Screen—PF8	5-8
Change Control DETAIL Screen	5-9
Change Control Processing Flow	5-10
Source Changes	5-10
CDMF Changes	5-10
Managing Change Control	5-10
Change Control Reports	5-11
Report Descriptions	5-11
JCL for Generating the Change Control Reports	5-16
Select, Sort, and Print	5-17
Problem Specifications—Change Control	5-18
Summary	5-20
Data Group Definition	6-1
Purpose	6-1
Topics	6-2
Objectives	6-2
Data Groups	6-3
Data Group Fields.....	6-4
Data Group Action Codes COBOL Copybook P49022D	6-6
Data Group Result Codes COBOL Copybook P49023D	6-7
Data Group Field Inquiry/Maintenance	6-9

Display of PEM Internal Element ID	6-10
Display of the Data Group Line Types	6-11
Display of PEM Dictionary Characteristic Lines	6-12
Converted (Pre-CDMF) Data Group Field Definition	6-13
Locating By Data Group Field Sequence Number	6-14
Defining the Data Group	6-16
Step 1—Add the Base Screen	6-16
Step 3—Code the Data Group Fields	6-17
Data Group Field Definition Line Types	6-17
Inserting the Different Line Types	6-18
Inserting COBOL Continuation Lines	6-18
Result: Inserting COBOL Continuation Lines	6-19
Inserting COBOL Data Lines	6-19
Result: Inserting COBOL Data Lines	6-20
Deleting Data Group Definition Lines	6-21
Moving Data Group Definition Lines	6-22
Step 4—DDID Data Elements	6-23
Step 5—Save the Data Group Definition	6-24
Error in Data Group Definition	6-25
Invalid Clause Found	6-26
To Copy a Data Group Definition	6-27
Data Element Definition Screen	6-28
Data Group Definition Exercise	6-29
Problem Specifications—Data Group Definition	6-29
Summary	6-31
 Link and End Activities	7-1
Purpose	7-1
Topics	7-2
Objectives	7-2
Activity Definition	7-3
Activity Definition Header	7-4
Link Activity	7-5
End Activity	7-6
End Activity Definition	7-6
Problem Specifications—Link Activity	7-7
Summary	7-8
 Sequential Database Definitions/Activities	8-1
Purpose	8-1
Topics	8-2
Objectives	8-2
Sequential Data Bases—SDB	8-3
Introduction	8-3
Sequential Data Base Definition	8-4
Sequential Database Activities	8-7
Adding SDB Definition	8-8
Building an SDB File	8-10
Issuing an SDB Activity	8-11
Checking Result Fields	8-12
Setting the DG Action in a Program	8-13
Problem Specifications—Sequential Database	8-14
Sequential Database Exercise I	8-14

Sequential Database Exercise II	8-14
Sequential Database Access Research Exercise	8-15
Summary	8-16
 Hierarchical Database Definitions/Activities	9-1
Purpose	9-1
Topics	9-2
Objectives	9-2
Hierarchical Database—HDB	9-3
Data Group Hierarchy.....	9-5
DL/I Access Under PEM	9-6
Hierarchical Database Definition (HDB)	9-7
Hierarchical Database Hierarchy Definition.....	9-8
Hierarchical Database Environment Dependent Data	9-9
Hierarchical Database HIDAM DBD Definition	9-10
How PEM Uses Data Bases	9-11
Data Base Access Management	9-11
Physical Data Base Definitions.....	9-11
Hierarchical VSAM Management	9-12
IMS Data Base Management	9-12
Hierarchical Database Activities	9-13
Rule of Accessability	9-15
Checking Result Fields.....	9-16
Hierarchical Database Access Research Exercise	9-17
Problem Specifications—HDB Activity	9-19
Summary	9-20
 Program Definition	10-1
Topics	10-2
Objectives	10-2
Program Definition	10-3
Program Execution	10-6
Establishing Addressability	10-7
Data Usage	10-7
The User Transaction Control Block	10-8
Activity Execution	10-15
Problem Specification—Program Definition	10-17
 Transaction Definition	11-1
Topics	11-2
Objectives	11-2
Transaction Definition	11-3
Umbrella Transaction Definition Activity List.....	11-5
To Display the Individual Activity Definition	11-6
Activity Definition Selected From Transaction Definition	11-7
Environment Dependent Considerations	11-8
Execution Under Different Environments	11-10
PEM/Operating Environment Interfaces	11-11
CICS Interface	11-12
IMS/DC Interface	11-13
IMS/DC Fast Path Interface	11-14

IMS/Batch, IMS/BMP, and IMS/NMD Fast Path Interfaces	11-15
Batch Interface	11-16
Processing Flow	11-17
The Big Picture Revisited	11-18
Problem Specifications—Batch Transaction Definition	11-19
Summary	11-20
Writing Programs to Run Under PEM	12-1
Purpose	12-1
Topics	12-2
Objectives	12-3
Programming Considerations	12-4
Program Invocation	12-4
Data Addressability	12-5
Activities Issued From a Program	12-6
Working Storage—Static Values	12-7
Hogan's Use of Binary Values	12-8
Halfword and Fullword Fields	12-9
COBOL Coding Conventions When Running Under PEM	12-11
Sample COBOL Program	12-13
Communication Among Programs	12-14
PEM Calling Chain	12-18
Checking Result Fields	12-20
The Precompiler	12-22
Precompiler Messages	12-22
Batch Program Execution	12-25
Problem Specifications—Batch Program	12-26
Suggested Steps for Problem Solution	12-28
Batch Problem Skeleton Program	12-29
Batch Problem Execute JCL	12-63
Summary	12-64
Date Services System—DTS	13-1
Purpose	13-1
Topics	13-2
Objectives	13-2
Date Services System (DTS)	13-3
Date Formats Supported	13-3
Date Calculations Supported	13-6
Holiday Calculations	13-7
Application Communication With Date Services	13-8
Date Service Actions	13-8
Date Services Online Test Screen	13-11
Field Description/Values	13-12
Date Service Research Exercise	13-14
Date Control Block	13-15
Date Services Actions Copybook T58007D	13-18
Date Services Results Copybook T58008D	13-22
Sample Program Using Date Services	13-25
Problem Specifications—DTS	13-26
Summary	13-27

CDMF Formats and PCD Formats	14-1
Purpose	14-1
Topics	14-2
Objectives	14-3
Process Control Data	14-4
Process Control Data Introduction	14-4
CDMF Concepts and Terminology	14-5
CDMF Components	14-5
Target Data Group	14-6
CDMF/PCD Key.....	14-7
Effective Dating Concepts	14-8
Defining a Format	14-9
Steps to Define a Format	14-9
Format Definition Screen	14-9
Format Custom Processing Parameters	14-19
Accessing the Data	14-20
Commonly Used Actions and Function Keys for CDMF Items	14-21
Defaulting Concepts	14-22
Format Level Defaulting.....	14-22
Format Defaulting Examples	14-23
Item Level Defaulting.....	14-24
Item Level Defaulting Examples	14-25
Application Access to CDMF Formats	14-26
Accessing CDMF—New Technology	14-26
CDMF Application Control Block	14-27
CDMF Action Codes—Copybook U48004D.....	14-28
CDMF Result Codes Copybook U48024D	14-30
Problem Specifications—CDMF Access	14-32
CDMF Access Diagram	14-33
How Old and New Formats Differ	14-34
Items Converted From the PCD System.....	14-34
2005 Format Definition	14-35
Converted PCD Custom Processing Parameters	14-36
47190 Format Definition	14-38
Application Access to PCD Formats	14-39
Accessing Simulated PCD—Converted.....	14-39
Data Group 1452 Copybook I57101D	14-40
PCD Action Codes Copybook I57104D.....	14-41
PCD Result Codes Copybook I57105D	14-42
Problem Specifications—PCD Access	14-45
PCD Diagram	14-46
Problem Specifications—Format Definition (Optional Exercise)	14-47
Summary	14-49
Condition Code Processing—CCP	15-1
Purpose	15-1
Topics	15-2
Objectives	15-3
Condition Code Processing Capabilities	15-4
User-Defined Exceptions	15-4
CDMF Format 1301	15-5
Invoking CCP	15-6
CCP Program Definition.....	15-8

CCP Item Key.....	15-9
CDMF Format 1301	15-11
Format Item Maintenance.....	15-11
Format Definition for CCP.....	15-12
Target Data Group	15-12
Processing Flow	15-13
Fields Set by Application Program.....	15-13
Process Flow.....	15-15
Data Flow Between the TCB and Data Group 48551	15-15
Copybook for Data Group 48551	15-16
Problem Specifications—CCP	15-17
Create CDMF 1301 Entry - Phase I	15-17
Remove Activity 14 from CDMF 1301 Entry - Phase II	15-17
Summary	15-18
 Testing, Debugging, Dumps Under Umbrella	16-1
 Purpose	16-1
Topics	16-2
Objectives	16-3
Testing	16-4
Activity Driver	16-4
Online Operation.....	16-4
Batch Operation	16-5
Testing, Debugging, and Dump Activities	16-6
Dump Activity	16-6
Exception Activity	16-7
Data Base Rollback Request	16-7
Delivered Exception Activities	16-7
Exception Activity	16-8
Exception Activity Vs Dump Activity	16-9
Dumps	16-10
Dumps: Friend or Fiend?	16-10
How to Approach the Abend	16-10
Common Error Messages	16-11
Dump Options	16-13
Option Keywords—Batch.....	16-13
PEM Formatted Dump Options	16-13
Online Dump Options.....	16-14
System Memory Access Retrieval Tool (CICS).....	16-16
System Memory Access Retrieval Tool	16-17
SMART/ABM Tutorial.....	16-17
SMART Commands and General Syntax.....	16-18
SMART PF Keys	16-19
Symbolic Addresses	16-20
SMART Dump	16-24
SMART Header Screen	16-24
SMART Storage Display Screen	16-25
Activity Breakpoint Monitor (ABM)	16-25
Using ABM	16-26
Activity Breakpoint Monitor Display	16-27
PEM Formatted Dumps	16-28
Example of a PEM Formatted Dump	16-29
PEM Formatted Dump Exercises	16-44
Summary	16-45

Mapping Support Facilities	17-1
Purpose	17-1
Topics	17-2
Objectives	17-2
Introduction	17-3
Work Area Activity Definition	17-3
Data Communications Activity	17-5
Deblock Service	17-6
Display Service	17-7
Map Definition Maintenance	17-8
Steps to Add a Map Definition	17-9
Step 1—Add Map Definition Base Screen	17-10
Step 2—Displaying the Design Screen	17-11
Step 3—Painting the Screen	17-12
Step 4—Display the Field Definition Screen	17-14
Step 5—Identify the Modifiable Fields	17-21
Using the Locate Command	17-21
Data Group Element Locate Screen	17-22
Using the Element ID	17-22
Using the COBOL Name	17-23
Step 6—Assign Attributes to Data Fields	17-24
Step 7—Save the Map Definition	17-25
Step 8—GEN the Map Definition	17-26
Step 9 -Assemble the Map	17-27
Batch Map ASSEMBLER	17-28
Map Editor Errors	17-30
Example of Error During Edit Session	17-30
Example of Error During Edit Session	17-31
Example of Error During Map GEN	17-32
The Map Display Feature	17-33
Viewing Options of Map Field Definition Maintenance	17-34
Problem Specifications—Map Definition	17-35
Suggested Steps for Problem Solution	17-36
Map Documentation/Assembly JCL	17-37
Summary	17-38
Prompt/Work Transactions	18-1
Purpose	18-2
Topics	18-3
Objectives	18-3
Example Transaction	18-4
Transaction Activity List Screen	18-5
Activity Definition 488301	18-6
Map Definition U88201M	18-7
Map Design Screen	18-8
Field Definition Screen	18-9
Field Definition 2 Screen	18-10
Data Group Definition 488401	18-11
Data Group Fields	18-12
UEPR Transaction Definition	18-13
UEPR Prompt Transaction Display	18-13
Transaction Flow Example	18-15
Online Transaction Flow Exercise Solution	18-17

Problem Specifications—Prompt/Work Transaction	18-18
Sequential Database Access - Phase I.....	18-19
Random Database Access - Phase II.....	18-21
Summary	18-22
Executing a Program Online	19-1
Purpose	19-1
Objectives	19-2
Invoking a Program Online	19-2
Problem Specifications—Execute Program Online	19-3
Link to Application Program - Phase I.....	19-3
Enhance Map/Random Access - Phase II.....	19-4
Summary	19-5
Function Processing System—FPS	20-1
Purpose	20-1
Topics	20-2
Objectives	20-2
FPS Features	20-3
Basics of FPS	20-4
FPS Environment Flow.....	20-4
Application Control	20-5
FPS Scenario Schematics	20-6
Information Needed by FPS	20-7
FPS Application Definition Requirements.....	20-7
Application Programs Running Under FPS	20-8
Application Maps Running Under FPS	20-8
FPS Maintenance Screens	20-9
Application Table Screen	20-13
Menu Processor Control Data Screen.....	20-14
Conversation Control Screen	20-16
Conversation Condition Code Screen.....	20-18
FPS and CDMF	20-19
Summary	20-20
FPS Application Requirements	21-1
Purpose	21-1
Topics	21-2
Objectives	21-2
FPS Requirements	21-3
Transaction Definitions.....	21-4
Application Table Entry	21-5
Control Definition for Main Menu	21-6
FPS Operator Security Control	21-7
Relationship of FPS to Application Programs	21-8
Application Requirements	21-9
Introduction.....	21-9
Communications Data Group 13589	21-10
Common Referenced Fields - DG13589	21-15
Common Modified Fields - DG13589	21-15
FPS Header Maps	21-16

I53589MA - Standard FPS Header	21-17
Setting of Condition Codes.....	21-22
Summary	21-25
FPS Basic Logic	22-1
Purpose	22-1
Topics	22-2
Objectives	22-2
Conversation Control Screen	22-3
Conversation Condition Code Screen.....	22-9
Methods of Communication Between Application Programs and FPS	22-14
Status Qualifiers - Program to FPS.....	22-14
User Environment Code - FPS to Program.....	22-14
Common Result - Program to Program	22-15
Branching to a Non-FPS Application	22-16
Basic Logic	22-17
Basic Logic Fields	22-17
FPS Logic Flowchart	22-19
FPS Basic Logic Flow UMBR Transaction.....	22-20
Summary	22-29
FPS Menu Processing	23-1
Purpose	23-1
Topic	23-2
Objectives	23-2
Overview	23-3
The FPS Menu Processor	23-4
FPS Branch/Exec Logic	24-1
Purpose	24-1
Topics	24-2
Objectives	24-2
Branch/Exec (Increase Level) Logic	24-3
FPS Logic Flowchart	24-4
FPS Walkthrough--Request for a Data Group	24-9
Action -END- (Decrease Level) Logic	24-25
Walkthrough of END Logic	24-25
Combined EXEC and END Logic	24-32
Branch/Exec and END Logic	24-34
Sort Activities	25-1
Purpose	25-1
Topic	25-2
Objectives	25-2
Sort Activity	25-3
Sort Activity Definition - IN(PUT)	25-5
Sort Activity Definition - OUT(PUT)	25-5
Sort Activity Definition - BOTH	25-6
Problem Specifications—SORT Activity	25-7
Problem Specifications—SORT Access	25-8

SORT Activity - Exercise I	25-8
Batch Skeleton Program - ZUPCxSY	25-9
Batch Skeleton Program - ZUPCxSZ	25-25
Batch Execute JCL - ZUPCXXEZ	25-55
Summary	25-56
 Scheduled Processing System - SPS	26-1
 Purpose	26-1
Topics	26-2
Objectives	26-3
Scheduled Processing System	26-4
SPS Execution	26-4
SPS Report Production Phases	26-5
SPS Menu Screen	26-7
Line Definitions (Programs)	26-11
Line Definition Commands	26-12
A—Issue a PEM Activity	26-13
P—Set Print Carriage Control	26-14
S—Execute Shared Format Definition	26-15
E—End Line Definition Processing	26-16
Format Definitions (Subroutines)	26-17
Shared Format Definition Commands	26-18
Format Definition Commands	26-19
CLEAR Instruction	26-20
ADD Instruction	26-21
SUBTRACT Instruction	26-22
MOVE Instruction	26-23
Data String and Print Line Position Notation	26-24
EDIT Instruction	26-25
Default Edit Patterns	26-25
User-Coded Edit Pattern	26-27
SPACE Instruction	26-29
SKIP Instruction	26-29
PRINT Instruction	26-30
IF (Compare) Instruction	26-31
GOTO Instruction	26-32
END Instruction	26-33
ACTIVITY Instruction	26-34
SPS Program Walk Through	26-35
SPS Code Batch Print	26-40
Online Coding of an SPS Program	26-43
GENing the SPS Report Parameters	26-57
Functions of the SPS Editor	26-58
Copy Feature	26-58
Online Example of Copy	26-58
SPS Error Messages	26-63
SPS Dumps	26-64
Step 1—PEM Exceptions Report	26-64
Step 2—System/User Code	26-65
Step 3—SPS Flower Box	26-66
Step 4—Data Group Storage	26-67
SPS CDMF Structure	26-69
SPS Line Definition—PCD 2300	26-69
SPS Format Definition—PCD 2302	26-71

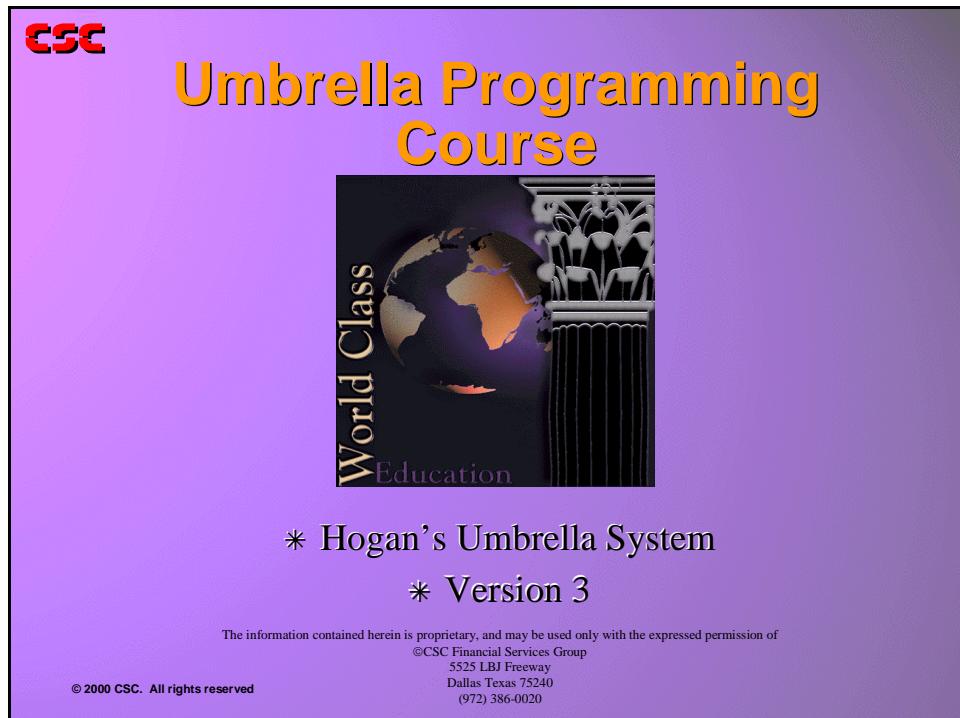

Using SPS PCD 2300 and PCD 2302	26-72
Common SPS Errors	26-73
Summary	26-75
SPS Implosion	27-1
Purpose	27-1
Topics	27-2
Objectives	27-3
Overview of the Implosion Phase	27-4
Link Activity to Trigger an Implosion	27-7
Identifying a Reportable Incident	27-8
PCD 1618	27-9
PCD 15006	27-10
Illustration of the Relationships Among Data Groups in SPS	27-11
Structure of Data Group 3601	27-13
SPS Implosion Considerations	27-15
Example Implosion Program	27-17
Problem Specifications—SPS Implosion	27-20
Testing of Implosion.....	27-21
Reportable Incident.....	27-21
Summary	27-22
SPS Reports Production	28-1
Topics	28-2
Objectives	28-3
SPS Processing Control Program	28-4
Sort Phase	28-5
Default Sort Activity.....	28-5
SPS Sort Considerations.....	28-6
The Processing Control Entry	28-8
SPS Processing Control Screen	28-9
Example Processing Control Entry.....	28-11
SPSCTL Beg of Rept Section	28-12
SPSCTL Processing Section	28-14
Explosion Phase	28-15
Example Explosion Program.....	28-16
Output Phase.....	28-18
Example Output(Detail) Program.....	28-19
SPSCTL End of Rept Section	28-21
Problem Specification—SPS Explosion and Output	28-22
Execute JCL for SPS Exercise	28-23
Worksheet for Planning SPS Reports.....	28-25
Worksheet for Processing Control Entry	28-27
Summary	28-28
SPS Heading Processing	29-1
Topics	29-2
Objectives	29-3
Heading Processing	29-4
Page Overflow	29-4
D Line Definition Command	29-5

Page Overflow Line Definitions	29-6
Example Heading Program	29-7
Generating the Heading	29-8
Special Values of the D Command	29-8
DEC Format Definition Command	29-9
Printing a Specific Number of Lines	29-10
Problem Specifications—SPS Head	29-11
SPS Break Processing	30-1
Topics	30-2
Objectives	30-2
SPS Break Processing	30-4
BREAK Format Definition Command	30-6
Examples of Three Level Breaks	30-7
Example 1	30-7
Example 2	30-7
Example 3	30-8
Break Logic	30-9
Example Break Program	30-10
Printing the Last Set of Totals and Grand Totals	30-12
Problem Specifications—SPS Break	30-13
Summary	30-14
Umbrella System (UMB) Component Identification	A-1
CCP—Condition Code Processing System	A-1
CCS—Change Control System	A-3
DTS—Date Services System	A-4
EFS—Edit and Format System	A-5
FPS—Function Processing System	A-6
PCD—Process Control Data	A-7
PEM—Processing Environment Manager	A-8
RCS—Release Control System	A-9
SPS—Scheduled Processing System	A-10
UMB—Umbrella	A-11
Budget and Planning System (BPS) Component Identification	A-12
BPS—Budget and Planning System (BPS)	A-12
Consumer and Merchant Servicing System (CAMS) Component Identification	A-13
TCS—Consumer and Merchant Servicing System	A-13
Credit Risk System (CRS) Component Identification	A-14
RAS—Credit Risk System (CRS)	A-14
Earnings Analysis System (EAS) Component Identification	A-15
EAS—Earnings Analysis System	A-15
Financial Information System (FIS) Component Identification	A-16
FIS—Financial Information System	A-16
Financial Support System (FSS) Component Identification	A-17
CDS—Cycle Data System	A-17
CWS—Check Writing System	A-18
G/L—General Ledger Interface System	A-19
NAF—Name and Address System	A-20
OTP—Outstanding Transaction Processing and NSF—Insufficient Funds Processing ..	A-21
RST—Restraints System	A-22

SIM—System Integration Management System	A-23
Hogan Education Center Component Identification	A-24
HEC—Hogan Education Center	A-24
Deposits System Component Identification	A-25
DDA—Demand Deposit Application	A-26
DEP—Dynamic Environment Processing System	A-27
IDS—Deposits System	A-28
LOC—Line of Credit System	A-29
PPS—Priority Post System	A-30
TDA—Time Deposit Application	A-31
Loans System Component Identification	A-32
ILP—Loans System	A-32
Management Support System (MSS) Component Identification	A-34
MSS—Management Support System (MSS)	A-34
Online Collections System (OCS) Component Identification	A-35
OCS—Online Collections System	A-35
Online Delivery System (ODS) Component Identification	A-36
ODS—Online Delivery System	A-36
Platform Automation Support System (PAS) Component Identification	A-37
PAS—Platform Automation Support System	A-37
Preferred Client Services System (PCS) Component Identification	A-38
PCS—Preferred Client Services System	A-38
Relationships and Profitability System (RPS) Component Identification	A-39
CIS—Customer Information System	A-39
RPM—Relationships and Profitability Manager	A-40
 SPS Appendix	B-1
Introduction	B-1
Implosion Mechanics Program Characteristics	B-2
Program 1850 Logic Chain and Key Build	B-6
New Program Planning	B-8
Common SPS Errors	B-11
SPS Class Quick Reference	B-13
SPS Summary	B-16
SPS Report Creation	B-17
SPS Check-List	B-19

Course Information

1

Notes:

Prerequisites

Prerequisites

- One year IBM Information technology experience
- Working knowledge of COBOL

© 2000 CSC. All rights reserved

Description

Class Description

- Introduction and reinforcement of the basic concepts required for working with the Umbrella System
- Emphasis on research exercises and development of elementary, hands-on skill

© 2000 CSC. All rights reserved

Objectives

CSC

Objectives

- Describe the *Big Picture* under Umbrella System
- Locate various individual items on the Umbrella System by navigating through the online menus
- Diagram the general use of PEM and explain the use of Process Dictionary
- Explain how change to Hogan products is managed through the CCS.

© 2000 CSC. All rights reserved

CSC

Objectives

- Identify Process Dictionary components, their use, and the major fields in their definitions:
 - Data Groups
 - Data Bases (sequential and hierarchical)
 - Programs
 - Transactions
 - Maps
 - Formats (and PCDs)
 - Activities

© 2000 CSC. All rights reserved

Umbrella Programming

Objectives

CSC

Objectives

Become familiar with:

- Process Dictionary entries required to access a data base
- Types of data groups used in defining a data base
- Distinction between standard COBOL programs and Hogan- oriented COBOL programs.
- Establishment of addressability to data groups
- Authorized and executed activities
- Umbrella *Fullword* and *Halfword* field technology and conventions
- Umbrella's processing flow

© 2000 CSC. All rights reserved

CSC

Objectives

- Create, maintain, and access tables
- Understand CDMF files and their functions
- Process Dictionary items online cross-referencing
- Use cobol program modification, execution, testing, debugging
- Use Date Services calculations

© 2000 CSC. All rights reserved

Objectives

Become familiar with:

- Batch Data Communications and Batch Activity Driver
- Function Processing System transactions, and Non-FPS transactions differences
- Processing flow through an FPS transaction
- Basic instructions of a Scheduled Processing System (SPS) program
- Design objectives and processing phases of SPS

© 2000 CSC. All rights reserved

Logon Assignments

This class creates and modifies CDMF Process and Non-Process Dictionary components based on GROUP NUMBER. Its assignment and use is critical to successful exercise solutions. At HEC, the GROUP NUMBER also is used to construct the student USERID.

GROUP NUMBER : _____

At HEC, the CLASSROOM ID is used to construct the ownership code required for all new CDMF components, and the student USERID.

CLASSROOM ID: _____
ENVIRONMENT : _____

At HEC, the USERID is constructed of the CLASSROOM ID concatenated with the GROUP NUMBER.

USERID : _____

Umbrella Programming

Class Setup Procedures

PASSWORD: _____

When adding new Process and Non-Process Dictionary components, please use effective date 780101 and company DFLT(65535).

Change Control Number Assignment

This class creates and modifies CDMF Process and Non-Process Dictionary components, therefore a valid Change Control Number must be created and/or assigned. At HEC, the CHANGE CONTROL NUMBER is constructed with the GROUP NUMBER as the last two digits; the SITE is TRNG; and the APPLICATION is a constant of ZZ followed by the CLASSROOM ID.

CHANGE CONTROL NUMBER: _____

APPLICATION: _____

In a later chapter, you will create your group's Change Control Number, for use in this class. All new and existing CDMF components assigned to your group should be updated using this number.

Introduction to Hogan Systems

Hogan Systems

The image is a promotional graphic for CSC Financial Services Group Hogan Systems. It features the CSC logo in red and white at the top left. The main title "CSC Financial Services Group Hogan Systems" is displayed in large, bold, yellow serif font. To the right of the text is a 3D rendering of several colorful buildings in red, green, orange, purple, and blue, set against a light purple background with a subtle gradient and a faint watermark of a globe.

CSC Financial Services Group Hogan Systems

- ★ International Company
- ★ Established in 1977
- ★ Integrated Software Products Support Services

© 2000 CSC. All rights reserved

Hogan Systems, is an international company that provides integrated software products and support services to financial institutions worldwide, including money center, regional and community banks, building societies, credit unions and other financial organizations. Hogan Systems, was established in 1977 and is headquartered in Dallas, Texas. Hogan has offices in Camberley, England (London); Melbourne, Australia; Frankfurt, Germany and has several distributor relationships in other countries.

Hogan Systems merged with Continuum in 1996 to form a company prepared to offer clients worldwide, solutions in the insurance, healthcare, and financial applications. Later the same year, Continuum/Hogan merged with Computer Sciences Corporation (CSC), to form an even stronger company to not only provide software, but also a larger support resource base. Even though Hogan has changed its company name to CSC, the Hogan application products will continue to carry the Hogan name.

The technical foundation of Hogan applications is the Umbrella System. It is the Umbrella System architecture that provides the flexibility and high performance of the Hogan applications and allows for the exploiting of new technologies. The architecture provides for the sharing of information across applications, thus increasing productivity. The Umbrella links and controls common data processing

Umbrella Programming

Introduction to Hogan Systems

activities and communications between each of the Hogan modules using common programs, techniques and procedures.

The slide features the CSC logo in red at the top left. The main title "CSC Financial Services Locations" is displayed in large, bold, yellow text. Below the title, a black square contains the text "Headquartered In Dallas, Texas." followed by a bulleted list of international locations: "Camberley, England", "Melbourne, Australia", and "Frankfurt, Germany". To the right of the text are three small illustrations: the Statue of Liberty, a person in a cowboy hat, and a person in a British uniform. At the bottom left, there is a copyright notice: "© 2000 CSC. All rights reserved".

The unique flexibility of Hogan applications allows for creation of new product offerings without enlisting data processing or programming assistance. Users can establish the business parameters as the market needs dictate.

The modular design of Hogan applications allows institutions to implement the information systems that will provide the greatest return in a timely and cost effective manner. Additional applications can be added as they are needed to meet profitability and performance objectives.

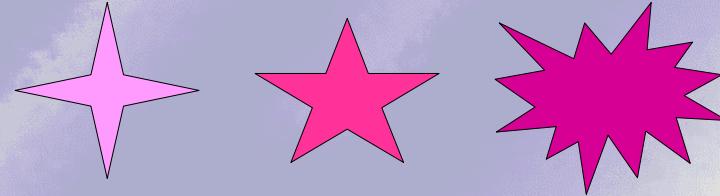

In addition to the advanced products, Hogan offers a full complement of implementation services and software support that includes onsite implementation consulting, management and planning as well as functional and technical project support. A complete education and training curriculum is offered with classes conducted at our training center in Dallas or at our customer locations. Product upgrades and enhancements are made available periodically to customers under a software maintenance agreement. Telephone support is provided 24-hours a day for problem resolution as is an electronic support system.

Company Changes

- Merged with Continuum in 1996
- Merged with Computer Sciences Corporation in 1996
- Company now known as "CSC/FSG"

Notes:

Umbrella Programming

Tower of Software

Tower of Software

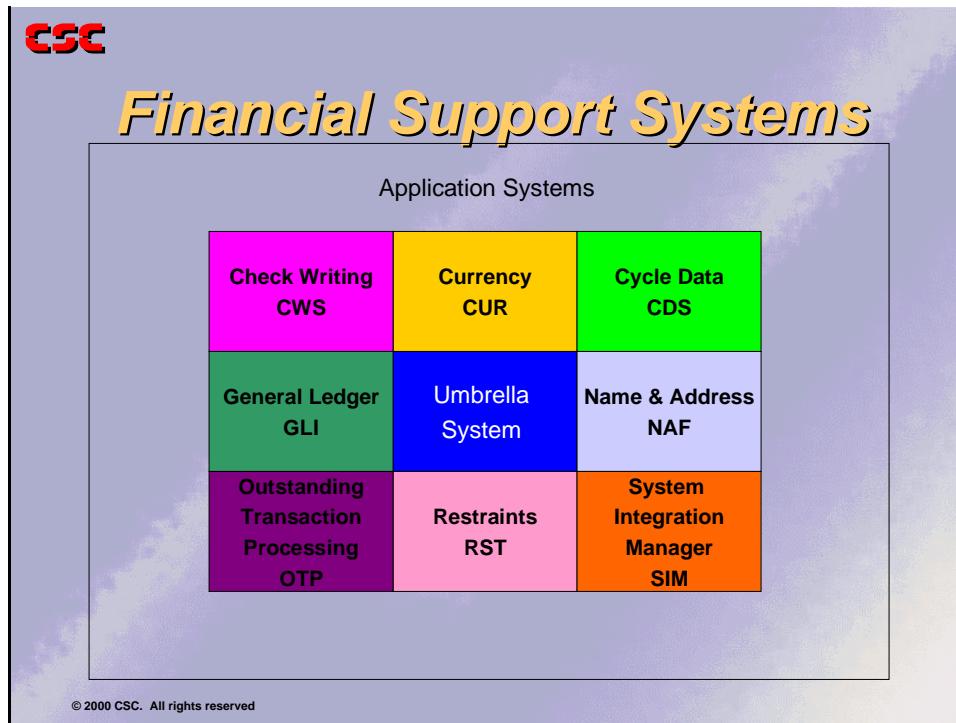

Notes:

Financial Support Systems (FSS)

The purpose of the Financial Support Systems is to provide a common set of modules that can be used by many different applications and support systems. This concept results in one generalized routine rather than having separate ones in each application. The systems within the Financial Support System are delivered with all of the Hogan application systems. A Hogan application system may use one or more systems within this group. Some of the systems were formerly called the software pool.

Notes:

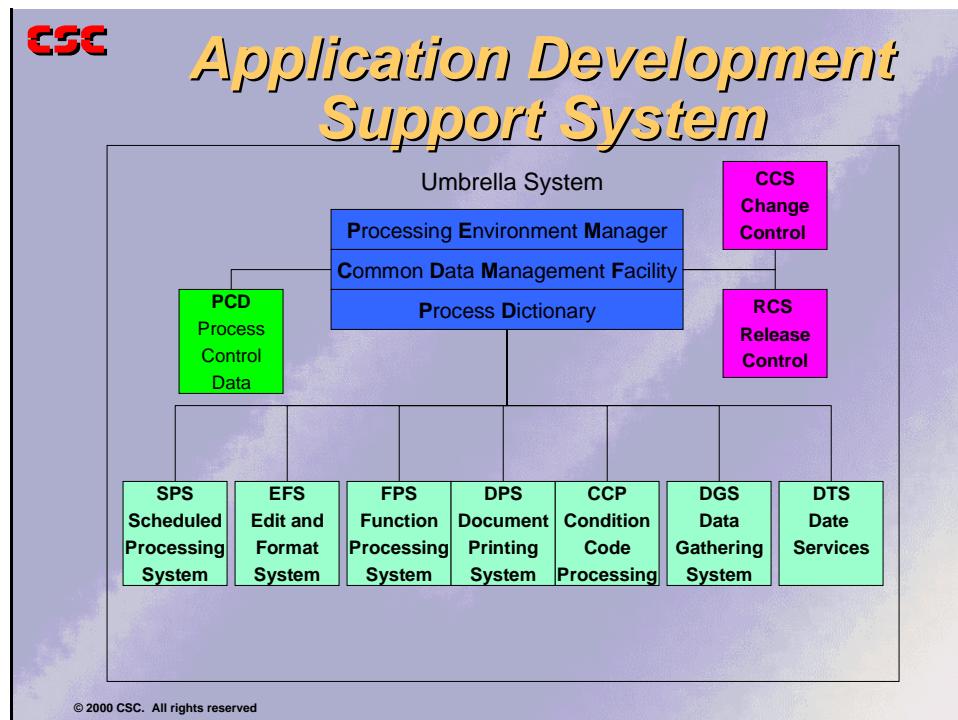

Umbrella Programming

Tower of Software

Umbrella Application Development Support Systems

There are several Umbrella Application Development Support Systems that provide standardized solutions to many common data processing problems. The support systems consist of programs, Process Dictionary entries, and online parameters. Some of the modules are invoked at the discretion of programmers. Others are activated by PEM. These modules standardize system design, improve productivity, promote consistency, and changes may take effect immediately or in the future.

Notes:

The following systems are included in the Applications Development Support Systems:

Change Control/Release Control Systems (CCS/RCS)

Changes are collected by change control number. The change control number must be authorized. It must exist on the change control master file, be open, and belong to the same family as the item being changed.

When changes are made to application systems, the Release Control System (RCS) in conjunction with the Change Control System (CCS) captures the changes. RCS saves a copy of the data as it was before the change and a copy of the data after the change. CCS records the fact that a change to the entity occurred and collects information about the change.

Process Control Data (PCD)

Process Control Data are process-directing variables stored on a data base external to the application. PCDs are tables of information maintained online. Their use builds flexibility into an application system. They save time and effort in design, programming, and testing for maintenance and enhancement. Many changes that would require program modifications under standard coding procedures are done simply by changing online parameters on a PCD.

Function Processing System (FPS)

FPS is a control system for implementation of online systems. It separates display programs from data-handling programs. It enables programmers to concentrate on the online aspects. FPS extends security through operator signons and passwords. It is built around processing levels that chain predefined user functions and, thus, sequences of screens. Up to 10 conversations can be carried on simultaneously with automatic resumption at a point of interruption. The Umbrella development screens are controlled by FPS.

Scheduled Processing System (SPS)

SPS is a report generator with math and logic capabilities. It captures data both online and in batch and constructs data strings. These strings are used to produce reports. Its language is maintained online. Some of the functions performed in SPS are building sort keys, formatting report lines, doing mathematical calculations, defining report sequences, totalling accumulators, and writing summary reports.

Date Services (DTS)

DTS provides for date calculations, manipulation of date formats, and business and holiday processing.

Umbrella Programming

Tower of Software

Condition Code Processing (CCP)

CCP provides a standard approach for identifying and handling the processing exceptions that occur within application systems. Through online parameters, logic flow for the exceptions can be controlled. Messages with explanations are maintained online for easy access by an application.

Edit and Format System (EFS)

EFS is a set of generalized, table-driven routines used for data manipulation. It is primarily used to validate data content and format. It is also capable of translating data, such as, internal to external format and code to description.

Document Printing System (DPS)

DPS provides for the formatting of online documents or reports for applications that run under the Umbrella. It is typically used when the same information needs to be printed on different forms in various locations or when variable data needs to be inserted in standard forms.

Data Gathering System (DGS)

DGS is used for matching and merging batch files. Up to 20 files and six fields can be handled. It allows for match, high, low, end-of-entity, and end-of-file conditions.

Notes:

Process Environment Manager (PEM)

PEM provides the interface or link between the user's logical application program and the physical environment.

PEM deals with:

- The teleprocessing monitor—CICS or IMS/DC
- The physical data structure—VSAM, DL/I, IMS, DB2
- The operating system—OS/MVS, XA, and ESA.

What this means to the manager, designer, or developer concerned with an application is that more time is spent solving the business problem and less time is spent dealing with the environment. Changes in technology are transparent to the application program.

All Hogan software executes under the control of PEM. PEM consists of 70 to 80 ALC CSECTs GENed for each processing environment. Its primary functions are to:

- Interpret the logical environment to the real environment;
- Interact with the operating system, data base management system, and teleprocessing monitor on behalf of the application programs;
- Manage resources for tuning transaction and data base frequencies;
- Obtain information for processing from the parameters stored in the Process Dictionary.

Umbrella Programming

Tower of Software

The Process Dictionary brings to the data processing industry a practical means of improving productivity. Program maintenance consumes 20% to over 80% of data processing resources. In addition to the cost factors, no one wants to do only maintenance. Maintenance limits time for new development that can satisfy user needs and improve processing.

The Process Dictionary can significantly reduce program maintenance. It allows the Umbrella user to store data and logic variables external to the application program. Beyond providing this storage medium, it includes an online and menu-driven facility for update and retrieval. Changes are made easily and dynamically.

Effective Dating is supported. It allows the user to define changes that are to go into effect in the future. Changes made using current date as effective date take effect immediately.

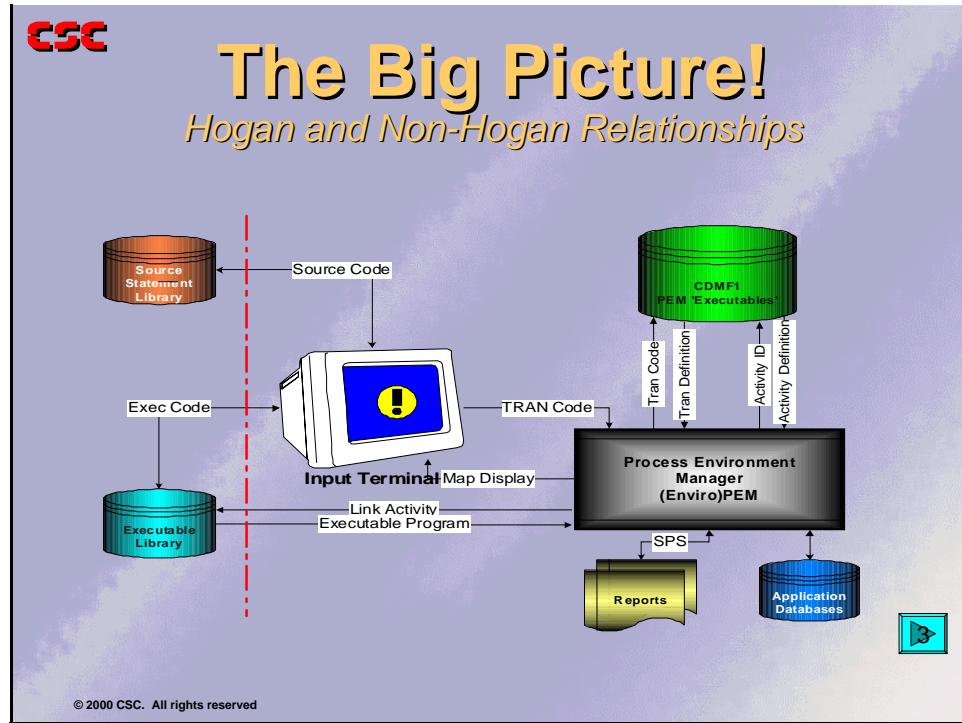

PEM obtains instructions for translating the logical environment to the real environment from the Process Dictionary. Each entry has a symbolic key that uniquely identifies it from other entries of the same type.

The types of definitions found in the Process Dictionary include:

DATA GROUP	A collection of one or more logically related data fields that are defined in a contiguous storage area.
ACTIVITY	A unit of work to be performed and the parameters for that work.
DATA BASE	A description of each logical data base and its structure.
PROGRAM	A description of the application program, the data it uses, and the activities it issues.
TRANSACTION	A list of work requests or activities to be done. A transaction equates somewhat to a job step or an online transaction.
MAP	A screen definition from which BMS or MFS source code is generated.
FORMAT	A description of variables stored on CDMF and accessed by programs to retrieve data for calculations, processing rules, verification, and description.

Umbrella Menu Hierarchy

Process Dictionary Main Menu

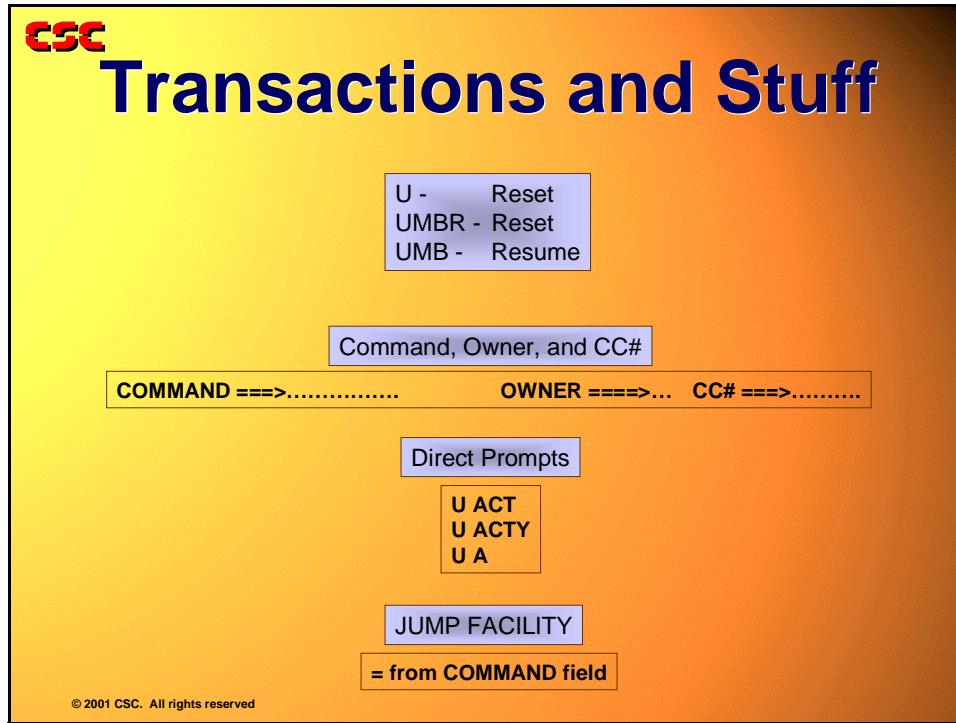

To access the "Umbrella System Process Dictionary Maintenance Menu", select option 1 from the "Umbrella System Master Menu" or enter U 1 from a cleared screen and press ENTER.

Notes:

Transactions

Notes:

Umbrella Transactions and Commands

UMB—Transaction

The UMB transaction, keyed from a cleared screen, will display the last screen of your previous Umbrella session.

UMBR—Transaction

The UMBR transaction will clear out any conversation that may have been in progress from a previous session and display the "Umbrella System Master Menu".

Command, Owner, and CC#

COMMAND ==>	OWNER ==> CC# ==>
-------------------	-----------------------------

These three fields are displayed on all non-menu CDMF and Process Dictionary screens. The COMMAND field is used to control and navigate the Umbrella System. The following pages contain the values that may be entered in this field. The two fields OWNER and CC# are required for use with commands for update, such as add, change, delete.

The instructor will provide owner and change control information later.

Umbrella Direct Prompts

Rather than go through each menu, it is possible to go directly to a particular screen using a direct prompt.

Umbrella Jump Facility

Umbrella Direct Prompts mentioned previously, are most commonly associated with the phrase "From a cleared screen, ENTER ... ". The Umbrella Jump Facility enhances the COMMAND field to be used as a receiver of Direct Prompts, or Jumps. The Jump syntax consists of the prefixing of any Direct Prompt with an equal sign "=".

Notes:

System Transactions

Menu of All Menus—MUAL

The MUAL transaction displays the MENU OF ALL MENU SCREENS. From this display any of the Hogan Applications can be accessed.

Notes:

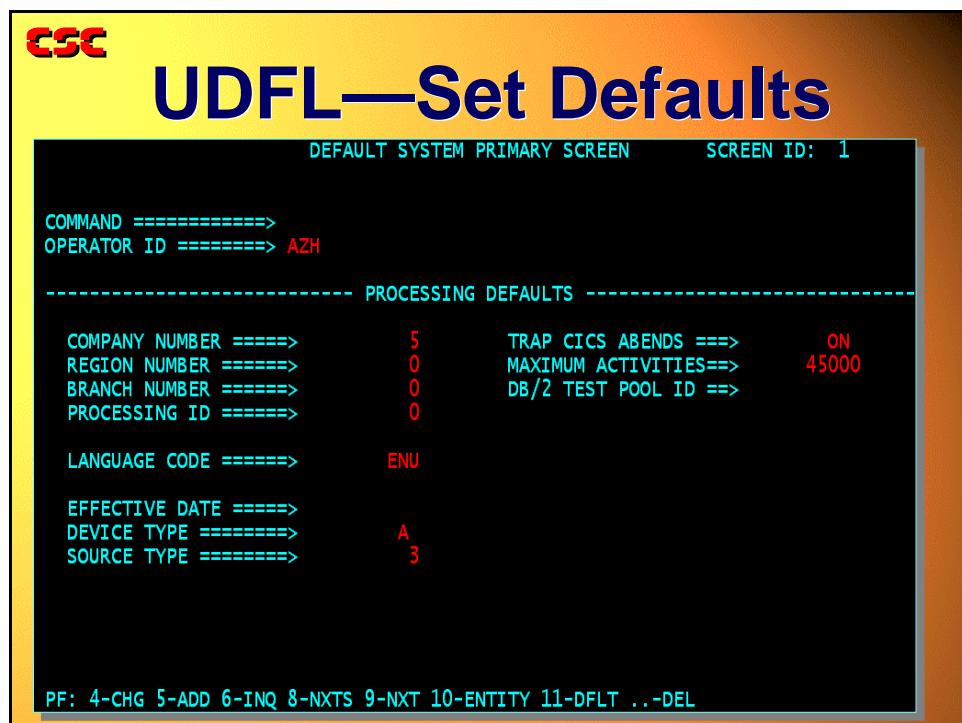

Umbrella Programming

System Transactions

Set Defaults—UDFL

The UDFL transaction replaces all internal and delivered mechanisms for setting default parameters for either a test or production environment. The default parameters are maintained by either Terminal ID or User ID. This transaction should be secured in a production environment. Even though the data is maintained on a CDMF data base, item maintenance is not used to maintain the parameters. Typically, only the date and company are required default parameters in a production environment.

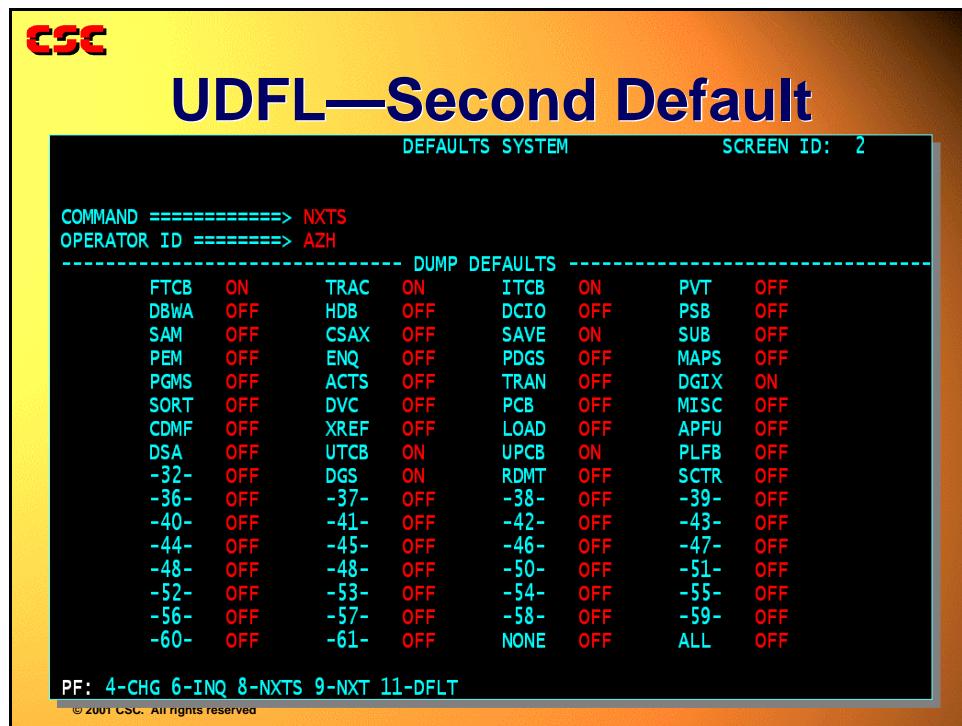

To display the first default screen enter UDFL, from a cleared screen.

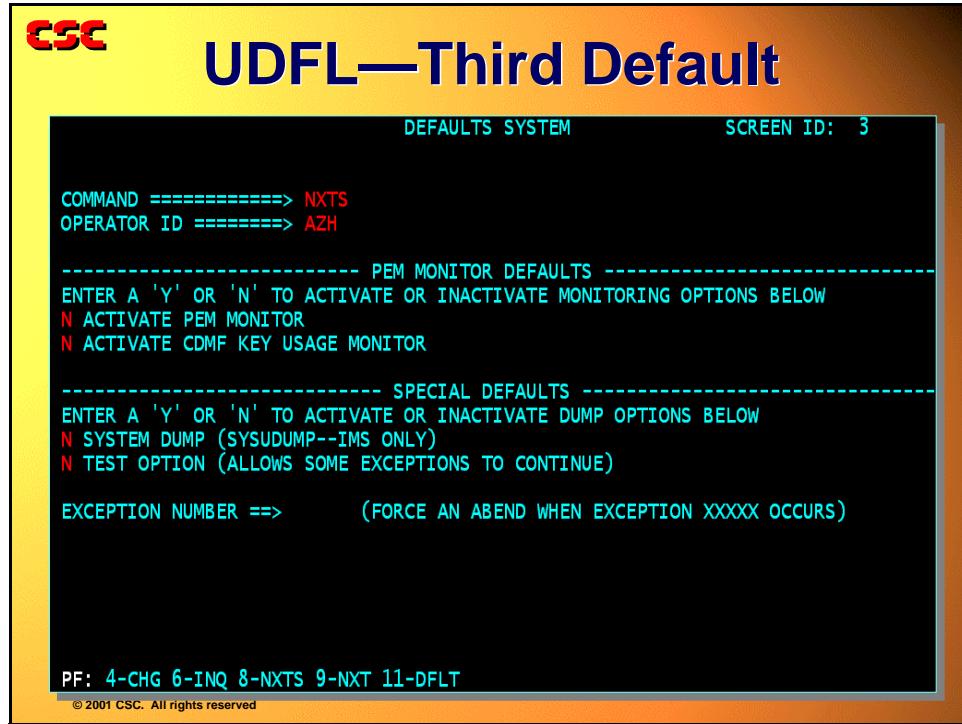

Notes:

To display the second default screen, press PF8.

To display the third default screen, press PF8.

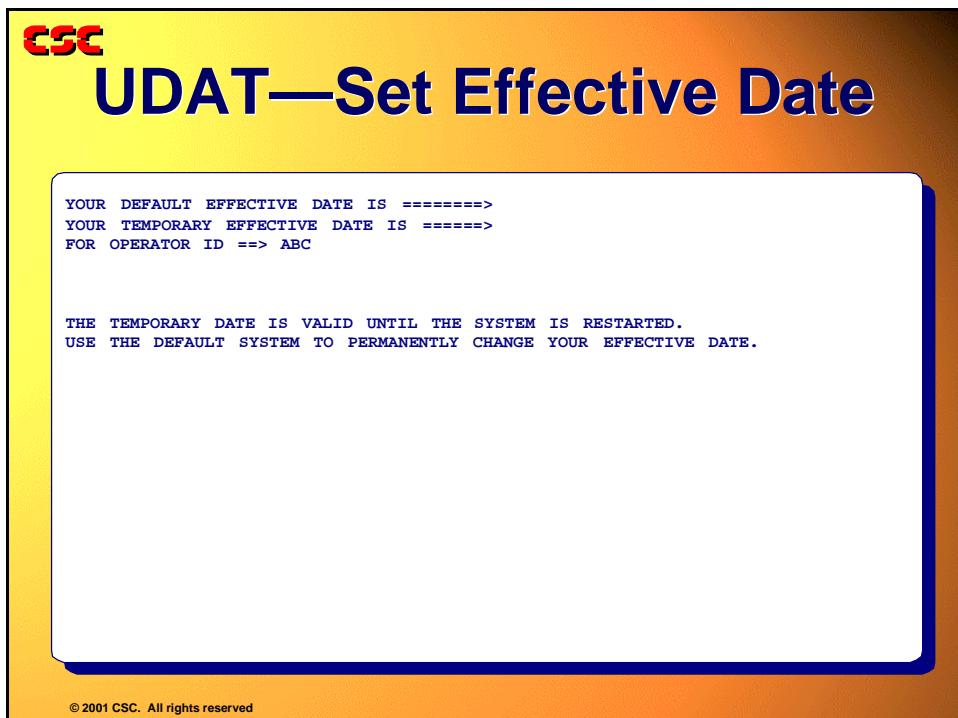

Umbrella Programming

System Transactions

Set Effective Date—UDAT

The UDAT transaction has been created to provide the same capability in an IMS environment as in a CICS environment. Also, in CICS, this transaction is no longer dependent upon the terminal control user area.

To set the effective date from a cleared screen, enter UDAT

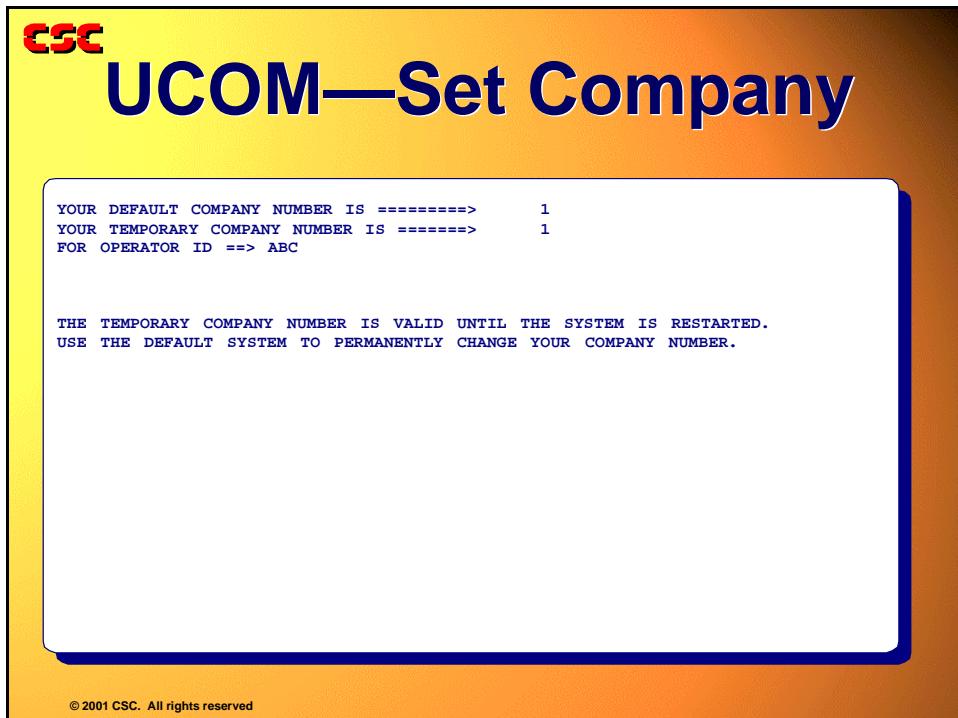

Notes:

Set Company—UCOM

The UCOM transaction has been created to provide the same capability in an IMS environment as in a CICS environment. Also, in CICS, this transaction is no longer dependent upon the terminal control user area.

Set the company from a cleared screen, enter UCOM.

Notes:

Umbrella Programming

Umbrella Screens Exercise

Umbrella Screens Exercise

1. From the Umbrella master menu, option _____ displays the Umbrella date services menu. From a cleared screen _____ will display the same Umbrella date services menu.
2. What is the length of data group 47100? _____.
3. To JUMP from data group definition 47100 to activity definition 15 one must enter:
 - From a cleared screen key JUMP ACTIVITY
 - COMMAND ==> =a 15
 - Press PF5
 - Key =act 15 in the DATA GROUP ID field
4. What happens when u 1 4 1 u48107m is keyed from a cleared screen?
5. What happens when u m u48107m is keyed from a cleared screen?
6. What is the description for program 703?

7. What is the activity type for 16400? _____
8. The primary search for program definition is by:
 - a) program description
 - b) program identification number
 - c) program link name
 - d) program source name
9. Associate a program function key with each of the following Umbrella system functions:

A.	PREVIOUS LEVEL	_____
B.	ADD	_____
C.	CHANGE	_____
D.	DELETE	_____
E.	GEN	_____

10. How many data groups are in the hierarchical data base EMP? _____

11. Format ID _____ is displayed using the prompt CCP.

Summary

The slide features a yellow background with a brown border. In the top left corner is the red CSC logo. The word "Summary" is centered in large blue text. To the right of the title are four interlocking puzzle pieces in green, pink, blue, and yellow. At the bottom left is a small copyright notice: "© 2001 CSC. All rights reserved". A small square icon with a triangle is in the bottom right corner.

- Batch and online updating
- The Umbrella System as menu driven
- Umbrella System access
- Secondary keys for search purposes
- PF key assignments

- Because PEM and the Process Dictionary provide means for accomplishing numerous standard data processing tasks, there are changes to learn for working under Hogan. Many pieces of the batch and online system are stored online and can be updated quickly in a real-time environment.
- The Umbrella System is menu-driven. Items can be located by walking through the menus. The direct prompt to the "Umbrella System Master Menu" is U from a cleared screen.
- Both alphabetic and numeric direct prompts are provided for access to any piece of the Umbrella System.
- Secondary keys exist for search of some Umbrella items, such as data elements.
- Alphabetic commands have corresponding PF key assignments, such as, ADD and PF5. Several are standardized across screens (PF1 through PF6, and PF9) while the others are assigned as needed. PF12 is for user assignment.

Objectives

CSC

Objectives

To become familiar with:

- Use of Change Control number with application ownership
- CCS online
- Source and online changes process
- Managing Change Control key issues
- Change Control reports
- JCL parameters for Change Control reports

© 2001 CSC. All rights reserved.

1. To explain the use of Change Control number with application ownership
2. To show which parts of CCS are maintained online
3. To describe how source and online changes are processed
4. To list key issues for managing Change Control
5. To list the general types of reports that can be requested through Change Control
6. To identify the updates made during class from information supplied on sample reports
7. To explain JCL parameters for Change Control reports.

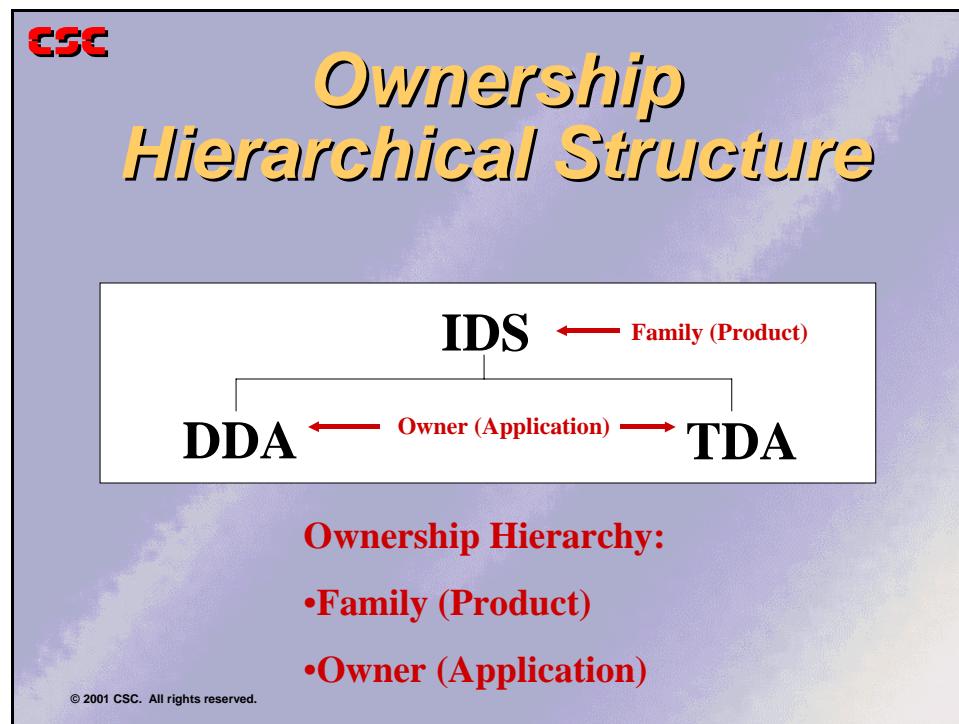

Change Control System

The change control system provides the facility to track and report all changes to the CDMF data bases and source modules.

The key to the system is site and change control number. The change control numbers are assigned to a specific Hogan Application (ownership) when they are set up. The site control record can be flagged to protect the transaction code on all maps and restrict changes to like application ownership.

Applications must be defined to PEM. They belong to families in a hierarchical structure such as:

Change Control Numbers may be assigned at the family level, or at the application level. If issued at the family level (IDS), all items within that family (IDS, TDA and DDA) may be updated. If issued at the application level (DDA), only items within that application (DDA) may be updated.

All source and CDMF data base changes are accomplished by using a change control number. No attempt is made to monitor application data base changes other than those on CDMF.

Online: all screens on the Umbrella System have required fields for Ownership and a Change Control Number.

Source: all programs, copybooks, and tables are maintained on a source manager (LIB, PAN, EDV, IEB) data base. Exits are provided for LIBRARIAN, PANVALET, and ENDEVOR to authorize change control numbers for all changes to source.

Online Maintenance

All Umbrella screens have a place for users to enter a change control number and ownership. When the change control number is added to the system, the ownership may be either a family or an application. The user must specify which by setting a flag in the site control record. Below is a sample screen to illustrate the location of these two fields required for updates.

Notes:

Umbrella Programming

Change Control System

Change Control Master

- The master file is a keyed VSAM or IMS data base.
- The key is site ID and change control number.
- It contains data concerning the overall scope of the change, such as:
 - Application Ownership
 - Person Assigned
 - Mandays
 - Description
 - Priority.

A master record must exist for a change control number. Associated records to describe the master more completely may exist. These records form a hierarchical data base, CCMSTR.

Change Control Detail

- The Detail file is a keyed VSAM or IMS data base.
- Its key is Site, Change Control Number, and Data ID.
- It contains information about data that has been changed, such as:
 - Name of Person
 - Date
 - Type of Data (such as map or PCD).

CCDETL is the Hierarchical Data Base of the detail records.

Change Control Inquiry/Maintenance

The following pages illustrate some of the Change Control data records as they would appear online.

Umbrella Programming

Change Control System

Change Control Processing Flow

Source Changes

Source changes are recorded by the source manager. For sites with LIBRARIAN, PANVALET, and ENDEVOR an exit is used to record the change on CCTRANS when a module is changed.

Nightly, a batch change control job is run that reads the transaction file and updates the detail and master files.

CDMF Changes

CDMF changes are logged as they occur on CCTXNDB. Source updates are logged on CCTRANS. Each night a batch run unloads the logged records, consolidates them and optionally updates CCLOG. Change control applies the consolidated change information to CCMSTR and CCDETL.

If a detail record already exists for the same control number, detail name, and change type, the detail record will be updated to reflect the latest change information. The use of CCS software is required to maintain any Hogan Application System. CCS is the only method of migration for CDMF items.

Managing Change Control

Managing the change control system is essential. The system control needs to be centralized. The person or small group in charge of change control can determine how numbers will be assigned and closed, when to run jobs to update the files, and who has access to CCS.

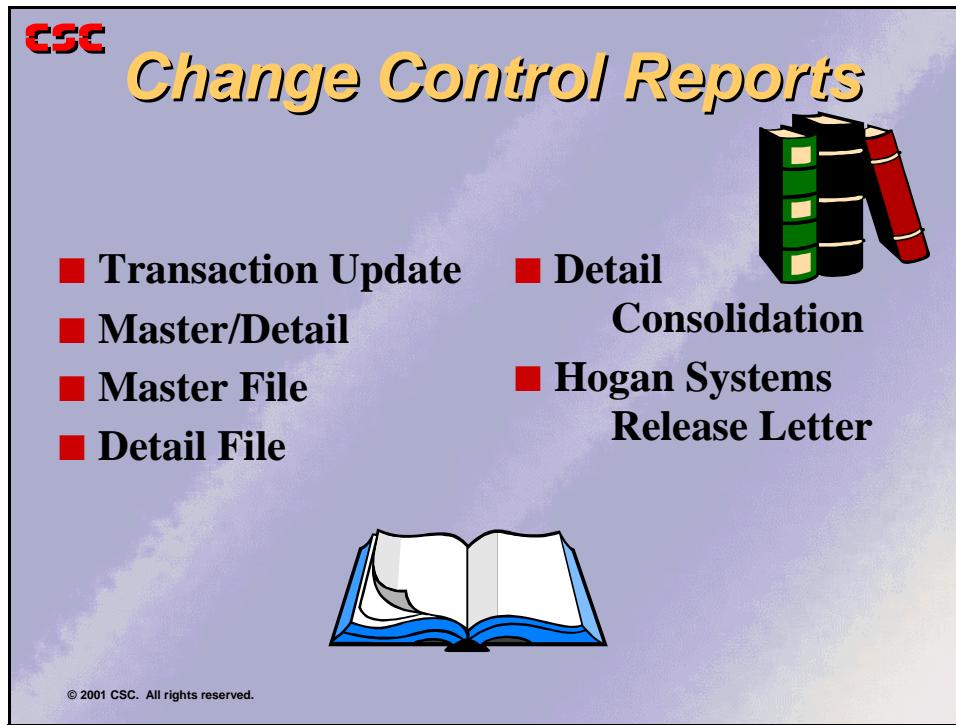

It is generally desirable to limit access to CCS through password and operator restrictions under FPS or via Site Security access to files. Actual assignment of change control numbers can be done manually or automatically at each site's discretion. To prevent the transaction files from filling up, batch jobs should be run nightly to update the master and detail files.

Use of the change control system can expedite custom changes and internal changes. It provides an automated system of migrating the changes from test to production. In addition, its use internally provides reports of user changes to apply to new releases compare to upgrades.

Notes:

Change Control Reports

Report Descriptions

There are many types of reports available through the Change Control System. The multi-purpose reports can be used to document updates, trace corrections, compare new releases with custom coding, review fixes, and manage staff.

The types of reports available through CCS include:

- TRANSACTION UPDATE REPORT

The purpose of this report is to reflect each transaction that is posted to the detail file. A comment indicates how the transaction was posted.

- MASTER/DETAIL FILE LISTING

The purpose of this report is to reflect the contents of the master file and, optionally, the detail records associated with each master.

The report indicates to whom specific control numbers have been assigned, the number of mandays, and the date to be completed. At the end of the report a product matrix can be requested that totals the item counts and mandays for each product. (See example on page 13.)

Umbrella Programming

Change Control Reports

- **MASTER FILE REPORT**

This report contains the change control master records built by the extract program.
The sequential input file can be sorted in any order.

- **DETAIL FILE REPORT**

This report contains the change control detail records built by the extract program.
The sequential input file can be sorted in any order.

- **DETAIL CONSOLIDATION REPORT**

This report prints a one line summary of the activity for each detail name.

- **HOGAN SYSTEMS RELEASE LETTER**

The purpose of this report is to provide the information needed for installations of new releases. It is produced for every release of a Hogan product.

Change Control Reports

JCL for Generating the Change Control Reports

The types of information that can be pulled in a change control report are extensive. Essentially, any field on the master record can be used as a key for generating the report.

The following sample JCL was used to generate the report on a typical class's work. It is a reference for the structure of the JCL and example selection criteria.

```
//JLBCCJOB JOB (HOGN,002,5050),'CCS JOB          ',  
//                  MSGCLASS=A,  
//                  NOTIFY=JLB,           STD TSO NOTIFY  
//                  TIME=(0,50),        ABORT AFTER MM,SS SECONDS  
//                  REGION=1500K       USE 1.5 MEG  
//P$$LIB  JCLLIB ORDER=xxxx.PROCLIB  
//*****  
//-----*

```

Notes:

Select, Sort, and Print

In the JCL, there are several files referenced. Both CCMSTR and CCDETL are included. CCMOUT and CCMIN are work files for reading and writing records.

Note that there are three processes in producing the report: selection, sort, and print. The three step process can be done in one job step. Transaction 1 59 4 is issued with control cards for each process.

In the select process illustrated here, the change control records that are to be chosen are those assigned to JLB. Select and assigned are the key words. Selection is a time consuming process as the entire change control master file is scanned.

For the sort, the order will be change control number by priority within signon. The sort work files are specified in the JCL.

There are actually two reports printed. The first one provides a summary of master records and the product matrix. The second one summarizes the detail records and breaks the information by priority within signon.

Please refer to the *Umbrella System Change Control Manual* for complete details and examples.

Problem Specifications—Change Control

Problem Specifications—Change Control

The following steps will walk you through the required Umbrella screens to establish your change control numbers.

The change control number available for your use is 9990xx where xx is your group number.

1. From a cleared screen enter the transaction code U.
2. Select option 3 from the "Umbrella System Master Menu".
3. Select option 1, change control maintenance.
4. Add your change control number based on the following:
 - A. COMMAND ==> add
 - B. SITE ==> trng
 - C. CHANGE CONTROL # ==> 9990xx, where xx is your group number.
 - D. DATA ==> m
 - E. APP ==> ZZ?, where ? is the classroom
 - F. PRIORITY ==> ____ Your choice: low, med, or high
 - G. REASON ==> ____ Your choice new development, deficiency, enhancement, custom or wish.
 - H. DESCRIPTION ==> _____ Be creative, but include your group number xx.
 - I. MATERIALS ==> UMB MANUALS and CLASS MANUAL
 - J. TARGET DATE ==> CLASS ENDING DATE (yr/mo/da)
 - K. ASSIGNED TO ==> ?xx, where ? is the classroom and xx is your group number.
 - L. MANDAYS ==> 10.0
 - M. DATE CLOSED==> 00/00/00
 - N. PRESS ENTER

Umbrella Programming

Problem Specifications—Change Control

- On the problem screen returned to you from Step 4 above, key narrative information and press ENTER. Later in the week when you start using the change control numbers, you may wish to update the comments on this screen.

Later, during this class, Change Control reports will be run to summarize the updates performed by each student group during the week. The reports will illustrate the type of information that can be pulled from the change control system to monitor your system. During the discussion of change control reports, additional details will be provided.

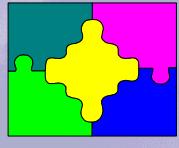

Notes:

Summary

Summary

© 2001 CSC. All rights reserved.

- Change Control System Reports**
- JCL structure**
- CCS**
- Online screens**
- Batch jobs**
- Central point for managing change control**

- There are multiple reports available through the Change Control System.
- The reports can help manage changes, document custom modifications, produce an audit trail, and manage staff.
- The structure of the JCL to provide the reports includes three processes: selection, sort, and print.
- CCS records information about the change.
- CCS records the before and after images that result from a change.
- The changes processed are those to source and CDMF items.
- CCS requires a master item that is keyed by site and change control number. Each change control number is authorized for a specific application and can be used by other applications within the same family.
- Hogan online screens require an ownership and change control number for updates.
- An input exit monitors source changes through one of four source managers (LIB, PAN, EDV, or IEB).

Umbrella Programming

Summary

- CCMSTR data base consists of a master base data group and several optional dependent data groups (problem, resolution, variance, and fix).
- CCDETL houses the detail records.
- There are online screens for maintaining CCS records.
- Batch jobs are run at night to record changes made during the day.
- A central point for managing change control is recommended.

- Identify components of data group definition
- Add a data group definition
- Access a data element definition
- List types of data groups that may occur on a data base definition

Data Groups

CSC

Data Groups

- Like a COBOL Copybook
- Defines Contiguous Storage
- Fields make up Data Group

© 2001 CSC. All rights reserved.

The number one rule about data under Hogan is that a field must be part of a data group that is defined to the Process Dictionary. This concept forms the foundation for data handling by PEM.

Data groups can be collections of work fields for totalling, setting flags, or one of an endless variety of possibilities. For example, the print line under Hogan is a data group. Data bases are logically defined through a data group or set of related data groups.

Data group definitions are used to define any memory space that is needed by a program, whether that space is in CPU memory (temporary space) or in file memory (permanent space).

Notes:

Data Group Fields

Data Group Fields

- Work Fields
- Print Line
- Terminal I/O Area
- Part of a Data Base
- Defined to the Process Dictionary
- First two fields
 - Action Field (2 bytes binary)
 - Result Field (2 bytes binary)

© 2001 CSC. All rights reserved.

PEM requires that data, other than constants, be defined as fields within data groups. Each data group is a logical collection of related fields. They can be work areas for user programs, parts of data base records, data fields for terminal I/O, and print lines. Data groups are normally defined on the Process Dictionary at application design time.

Although the definition of the fields within a data group can be determined by the requirements of the application, PEM does place one requirement on the format of a data group. The first four bytes of each data group are reserved for two, two bytes binary fields.

The first of these fields is called ACTION; the second is RESULT. The action field is used to tell PEM what is to be done with this data group and its contents. An example is a request for a read from a data base. The RESULT field is used by PEM to tell the application program the result of the requested ACTION. Example results passed to the application program through this field include X'0000' if the read is DGR-OK or X'0001' if DGR-END-DATA has been reached.

EXAMPLE OF COBOL DATA GROUP FIELDS

```
01  DATA-GROUP-11.  
    02  DG-ACTION-FIELD          PIC XX.  
    02  DG-RESULT-FIELD         PIC XX.  
    02  DG-FIRST-USER-FIELD     PIC ?.  
    ...  
    ...  
    ...
```

In COBAL Data Group definition, the ACTION and RESULT fields are always defined as PIC XX for reasons which will be explained later in the class.

EXAMPLE OF ALC DATA GROUP FIELDS

DATAGP11	DS	0F	
DGACTION	DS	XL2	ACTION FIELD
DGRESULT	DS	XL2	RESULT FIELD
FSTUSER	DS	?	FIRST USER FIELD
...			
...			
...			

To help you use and interpret the action and result fields, data group action and result copybooks are delivered with the Umbrella System. You can include these modules, P49022D for the Data Group Action Codes COBOL Copybook and P49023D for the Data Group Result Codes COBOL Copybook, in your COBOL application programs. Both modules have been placed on the following pages for your reference.

Data Groups

Data Group Definition

In this section we will examine the data group definition screens and interpret the information available on them. Data group 47915 will be used for this walk through.

The "Process Dictionary Data Group Definition Setup" screen shown below can be accessed three ways:

1. Through the "Umbrella System Master Menu" to the "Umbrella System Process Dictionary Maintenance Menu" to "Process Dictionary Data Group Definition Setup" and INQ on the data group ID 47915
2. With the jump facility: =DG 47915
3. From a cleared screen enter **U DG 47915 or U 1.1.47915**.

To view the field definitions contained within the data group press PF7 or enter **BROWSE** into the COMMAND field.

Display of PEM Dictionary Characteristic Lines

To display the PEM Dictionary Characteristic Lines enter SHOW in the COMMAND field and press ENTER.

To return to the original display enter **RESET** in the COMMAND field.

This display starts in column 9 only showing the C of DC. PF10 and PF11 can be used to shift the display to the left or right.

The DC lines contain the following information:

LN	Length of field.
OF	Offset of field within the data group.
TY	Field Type. C=Character, P=Packed, B=Binary.
FLG	Four position parameter field. <ul style="list-style-type: none">• Field Initialization/Batch Deblock flag.• Not used.• Not used.• Not used.
SD	20 position short description created from the COBOL name.
Columns 73-80	Data Element name

Converted (Pre-CDMF) Data Group Field Definition

Pre-CDMF did not support COBOL like data group definitions. A pre-CDMF Data Group Fields definition is displayed below.

Data Groups

Locating By Data Group Field Sequence Number

The Locate (L) command will position the Data Group Definition Inquiry Maintenance Screen to the desired line/sequence number.

To display line number 15, enter L 15 into the COMMAND INPUT field.

The screenshot shows a terminal window with the CSC logo at the top left. The title bar reads "Locating by Data Group Field Sequence Number". The main area displays a data definition listing. A yellow box highlights the command "L nn" in the input field. The listing includes fields like DATA GROUP ID, EFF DATE, COLS, MODE, and various data items like W915-ACTION, W915-RESULT, and W915-COMPANY. Some entries have TQE91501 through TQE91505 suffixes. The bottom of the listing shows a footer with copyright information and a series of asterisks followed by sequence numbers.

Notes:

Umbrella Programming

Data Groups

Defining the Data Group

Step 1—Add the Base Screen

Step 2—Request Edit Mode

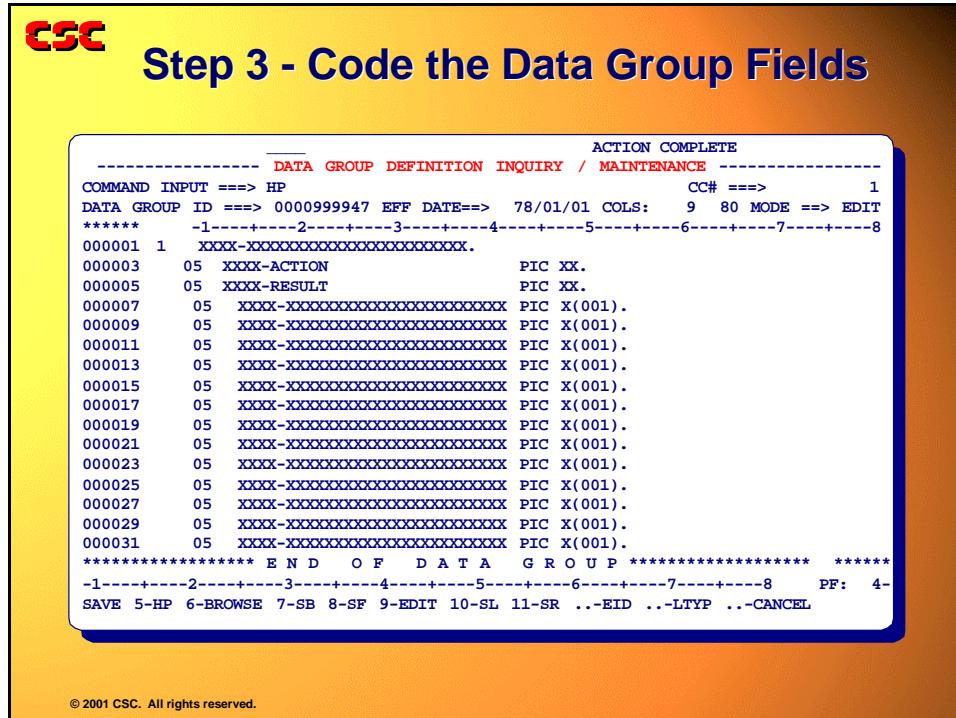

- Press PF8
- OR
- Enter **EDIT** into the COMMAND field.

Notes:

Step 3—Code the Data Group Fields

All lines initially displayed are COBOL Primary Lines. Only COBOL level and field definitions may be coded on this line type. Overkey the Xs to enter the COBOL field definitions. The edit mode is full screen. Terminal keys to delete and insert characters will work on this display. Press ENTER to record your statements.

Data Group Field Definition Line Types

LINES TYPES:

1. COBOL
2. PEM Dictionary

COBOL Line Types:

1. Primary Lines

Contain the level and group or element name.

2. Continuation Lines

Contain the lines for extension of a data group field definition to more than one line.

3. Data Lines

Contain information about data group field definitions, that is, comments and 88 level statements.

Umbrella Programming

Data Groups

Inserting the Different Line Types

Overkey the sequence line number with one of the following:

In - Insert COBOL Primary Lines
ICn - Insert COBOL Continuation Line
IDn - Insert COBOL Data Lines

(n = The number of lines to be inserted)

The line(s) are inserted after the line containing the command.

Inserting COBOL Continuation Lines

The screenshot shows a software interface titled "Inserting COBOL Continuation Lines". The main area displays a COBOL data definition. At the bottom of the screen, there is a status bar with the text "© 2001 CSC. All rights reserved." and a series of function keys: 5-HP, 6-BROWSE, 7-SB, 8-SF, 9-EDIT, 10-SL, 11-SR, ..-EID, ..-LTYP, and ..-CANCEL.

The D (delete command) on a COBOL primary line will delete all lines related to that COBOL primary line.

The D (delete command) on a data line, continuation line, or dictionary line will only delete that line.

| B | Before this line. |

Notes:

Step 4—DDID Data Elements

The ELEMENT NAME is coded in 73-80. This is also called the Data Dictionary Identification (DDID). The name is used to build an element entry in the Process Dictionary. The name is required in coding SPS programs and can be optionally used in map definitions.

Umbrella Programming

Data Groups

Step 5—Save the Data Group Definition

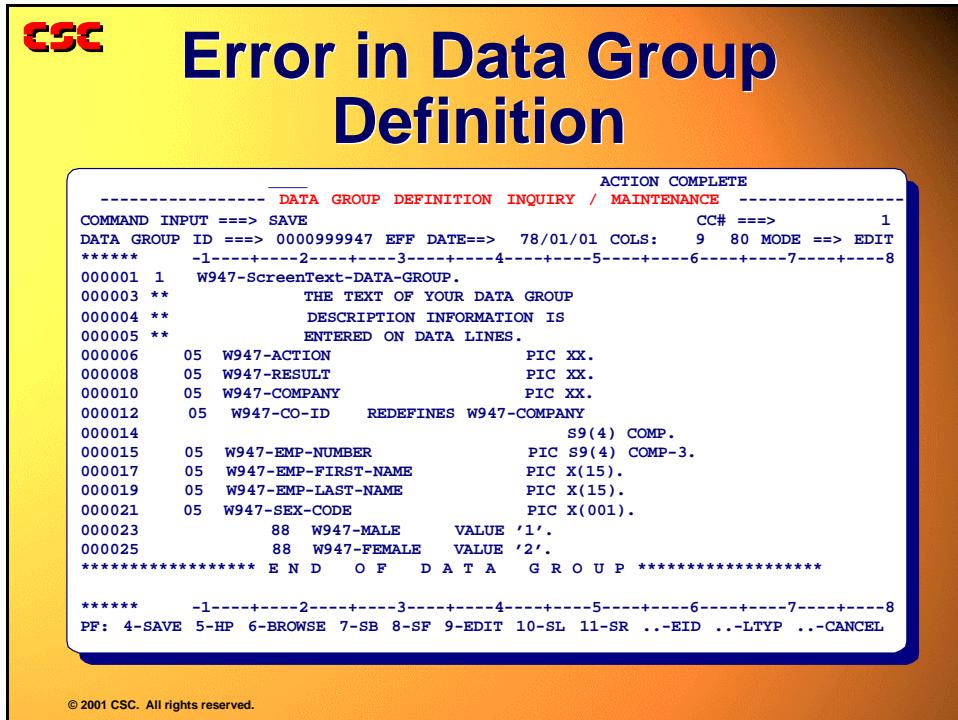

The save command performs the following:

- Recalculates all element characteristics.
- Verifies total Data Group length and corrects if length specified is too short.
- Updates the Element Data Dictionary.
- Replaces the source version of the data group definition on CDMF2.
- Does a GEN to create a new object version for PEM on CDMF1.
- Issues a new-copy function to load the definition into memory.
- Deletes the shadow copy.

Error in Data Group Definition

Notes:

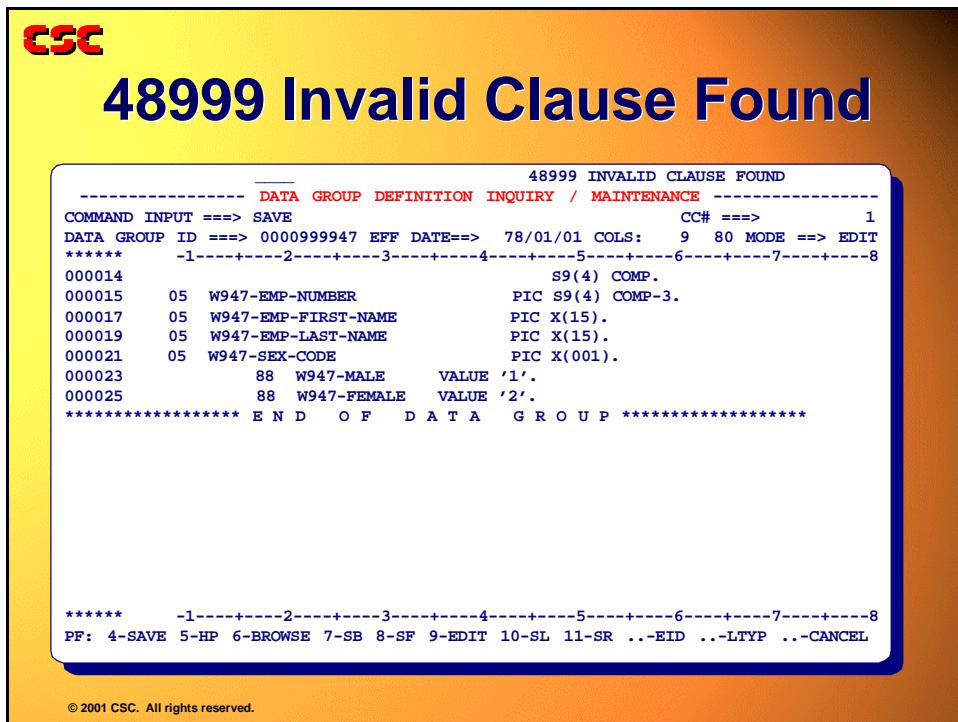

Umbrella Programming

Data Groups

Invalid Clause Found

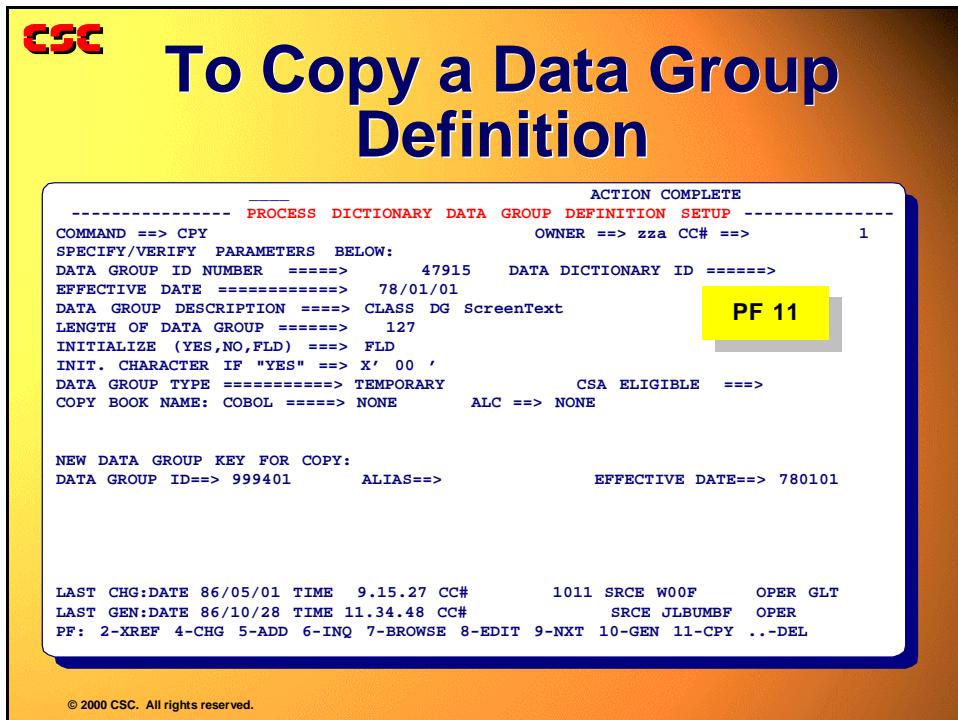

When the error is found the screen is redisplayed on the line in error.

Notes:

To Copy a Data Group Definition

Notes:

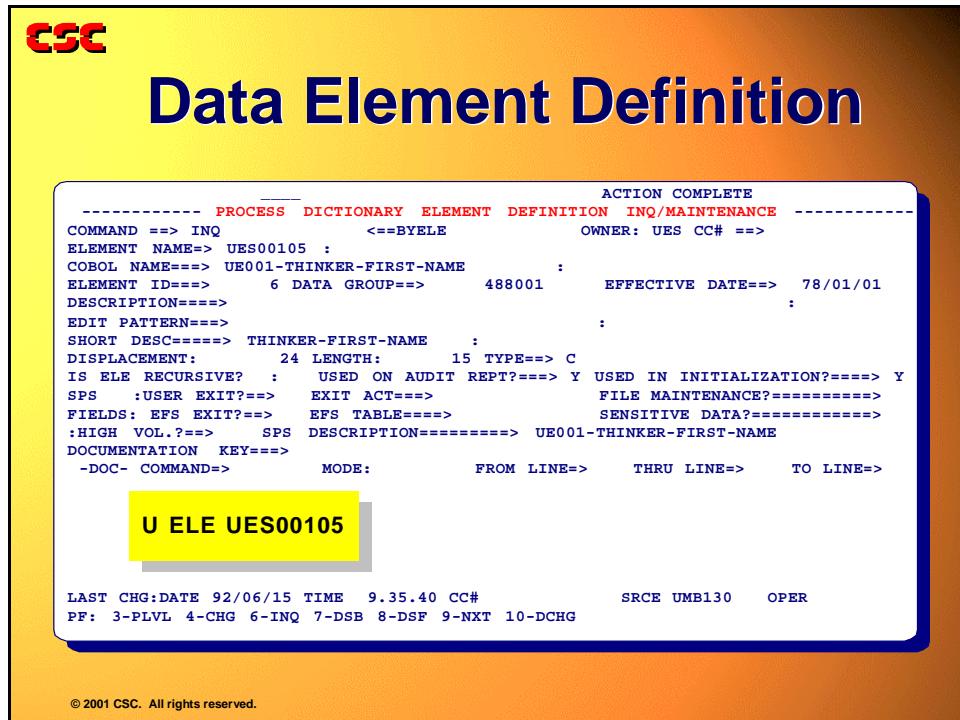

Umbrella Programming

Data Element Definition Screen

Data Element Definition Screen

The Data Element Definition Screen allows inquiry or maintenance on a specific element (field) in a data group. This facility does not provide ADD or DELETE capabilities for Data Element Definitions, nor does it allow CHANGES to the offset and length of the field.

From a cleared screen, the prompt to access the Data Element Definition Screen is U ELExxxxxx, where xxxxxxxx is the optional Data Element Name. This screen may also be accessed from the Umbrella Master Menu by selecting option 1.10.

Notes:

Data Group COBOL Data Structure Extract

COBOL format data structures can be extracted from the Process Dictionary data group definition by issuing an item exit to the Common Data Management Facility (CDMF) Dump/Restore facility. The data structures are written to file CCSOUT. Each of the resultant data structures is sandwiched between control cards that add it to the Source Management Facility specified on your Site Control Record PCD 48025. The supported formats include Endeavor, PDS, librarian, and Panvalet.

The output will be sent to a member in the Source Manager with the name that appears in the “COBOL” field of the Data Group Definition. Existing members will be replaced.

The control cards for the data group definition COBOL copybook extract appear as follows:

1 48 150

BROWSE ITMEX=48048 DGS=data group ID

To extract data structures for a range of data groups:

1 48 150

BROWSE ITMEX=48048 DGS=data group ID THROUGH data group ID

To extract data structures for all data groups:

1 48 150

BROWSE ITMEX=48048 DGS

JCL Notes:

- SORT SORTWKnn files may be required for this transaction.
- The CCSOUT file mentioned previously must be present for this transaction. An OS version of the CCSOUT DD statement is:

```
//CCSOUT DD DSN=your.DSN,  
//DISP=(PASS), UNIT=SYSDA, SPACE=(CYL,(9,5)),  
//DCB=BLKSIZE=6160
```

- Those who use IEBUPDTE to maintain a PDS source master must use PARM= NEW on the EXEC statement of the IEBUPDTE step. The card images produced to CCSOUT use a ./ADD control card.
- See job UTLC01 in member UMBJCLV (for VSAM environments) and UMBJCLI (for IMS/DB environments) for a complete job stream.

Umbrella Programming

Data Element Definition Screen

Data Group Definition Exercise

Problem Specifications—Data Group Definition

The data group should conform to the following specifications:

1. Use data group ID 9994xx (where xx is your group number).
2. The Data Dictionary ID should include your group number.
3. The data group description should include your group number.
4. The data group is to have a total length of 100 bytes.
5. The data group should be field initialized.
6. The data group should be a temporary data group.
7. The COBOL Copybook name is Z9994xxD. There are no ALC Copybooks.
8. Use the owner application and change control created in the Change Control Exercise.

Umbrella Programming

Data Element Definition Screen

As you define your data group, complete the data group definition check-list.

1. The 01 level should include your group number.
2. Data group ACTION and RESULT fields.
3. Company ID Number. Define as character and redefine as halfword binary.
4. Employee Number. Define as 9(11) COMP-3.
5. Employee Lastname. Define as 15 characters.
6. Employee Firstname. Define as 15 characters.
7. Department Code. Define as 3 characters.
8. Job Class Code. Define as 2 characters.
9. Job Position Code. Define as 2 characters.
10. Current Earnings. Define as S9(7)V99 COMP-3.
11. Y-T-D Earnings. Define as S9(7)V99 COMP-3.
12. Occurs counter. Define as S9(3) COMP-3.
13. Five (5) Employee salary adjustments. Define as S9(7)V99 COMP-3. You may want to use an OCCURS clause.
14. Type of processing. One byte character field to indicate random or sequential processing. Associate two 88 level statements to identify the type of processing.
15. Filler as needed to bring the length of the data group to 100 bytes.
16. Assign a Data Element Name to all fields except the Action, Result, and the FILLER field. The Data Element Name should follow the naming standard ZUPCxnn, where xx is your group number and nn is a sequence number between 00 and 99.
17. Was the data group saved? _____
18. Is the data group length 100 bytes long? _____

Summary

Summary

- ✓ Data Group definition is used to define any memory space needed
- ✓ Field must be part of data group to be accessed within Hogan system
- ✓ First two fields of data group are ACTION and RESULT

Objectives

CSC

Objectives

- Define an activity
- Add an activity definition to the Process Dictionary

© 2001 CSC. All rights reserved.

Activity Definition

An Activity is a UNIT OF WORK to be performed. The Activity Definition contains information required to accomplish the work request. There are several types of Activities defined in the Process Dictionary. For example, Work Area activities are used to allocate, initialize, and release Data Groups; Data Base activities are used to read and write Data Base Data Groups; Data Communications activities are used to deblock and display data in an online environment.

An activity request may be made through a Transaction Definition or by a program in a call to PEM. In either case, PEM locates the definition of the activity to be performed in the Process Dictionary and performs the work specified by the activity. Should PEM be unable to locate the Activity Definition, an exception message will be produced and the transaction will abnormally end.

Activity Definitions are categorized by the type of service they perform. Each category has a corresponding service routine within PEM. All of the activity types will be addressed in this class, but not in this chapter.

Umbrella Programming

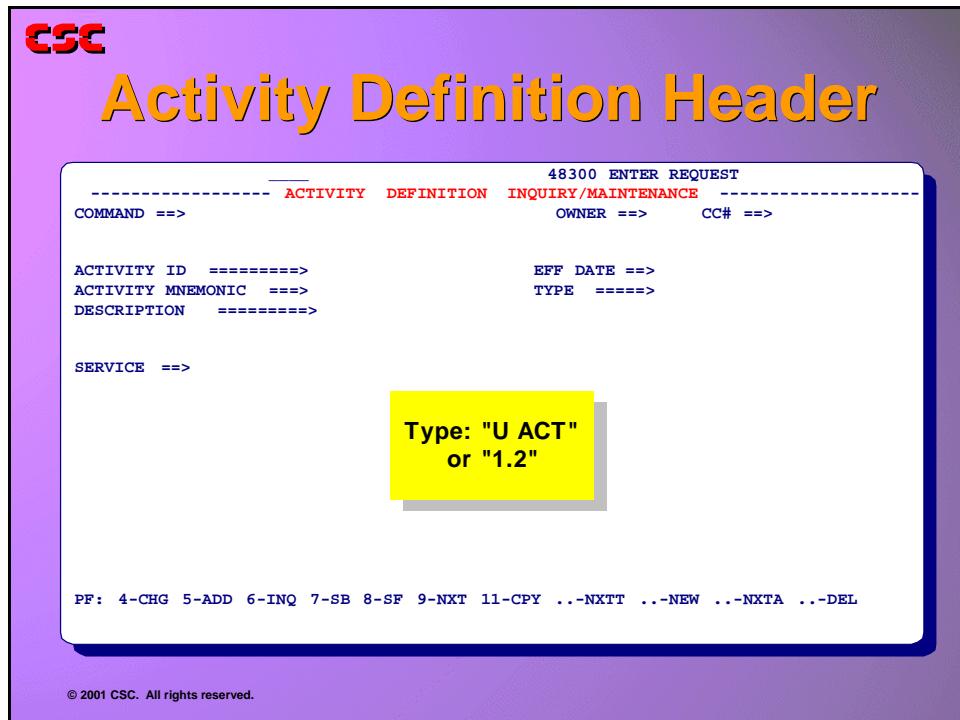

Activity Definition Header

Activity Definition Header

The first few lines of the "Activity Definition Inquiry/Maintenance" screen are common to all types of activities.

To display the Activity Definition header screen:

- Enter **U ACT** from a cleared screen
 - or
- Enter **=1.2** into the COMMAND field of another Process Dictionary screen
 - or
- Enter **2** into the OPTION field of the "Umbrella System Process Dictionary Maintenance Menu".

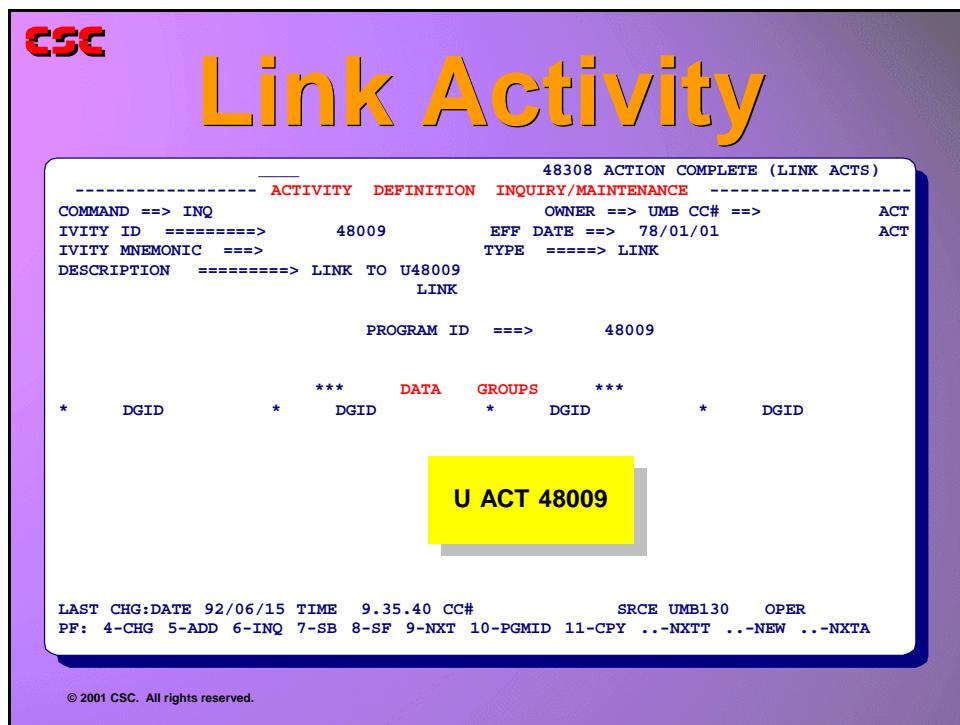

From this screen you can display an Activity Definition by ID or by TYPE.

Link Activity

The Link activity is used to transfer control to a program. It specifies the key to the Program Definition on the Process Dictionary. PEM executes the Link activity by looking up the Program Definition on the Process Dictionary, locating the load module referenced on the Program Definition, establishing addressability to the Data Groups needed by the program, and transferring control to the program.

If the target program of the Link activity has dynamic data groups defined, it is possible to pass addressability to specific Data Groups with a link activity. To accomplish this, a list of data group IDs is placed on the Link Activity Definition. The first data group ID will have its address placed in the first dynamic cell in the target program's parameter list. The second data group ID will be passed in the second dynamic cell, and so on.

End Activity

The END Activity is used to either end a program or a transaction. All programs must terminate execution by issuing an END Program Activity. In most cases, END Transaction Activities are optional.

Predefined activity IDs for END are:

- ACTIVITY 1—END PROGRAM.
- ACTIVITY 2—END TRANSACTION.

End Activity Definition

Sequential Data Bases—SDB

Introduction

Sequential data bases are simple sequential files that may be fixed or variable in length. They can contain a variety of different kinds of data, including, but not limited to:

CSC

Sequential Data Bases - SDB

- SYSPRINT
- SPS Reports Data String File
- Change Control Log File
- Application Transaction Files
- Checkpoint Data
- Batch Maintenance Files
- Scrub Files
- Dump/Restore Files
- Etc.

© 2001 CSC. All rights reserved

Sequential files can be stored on disk or tape. They can also reside on unit record devices such as card readers, printers, and fiche. The access methods currently supported for SDB files are BSAM, QSAM, and VSAM/ESDS.

A sequential data base record is comprised of one data group per logical record. This data group is used as an I/O work area for reading and writing the record data. The required action and result fields of the data group are never written to any file.

Notes:

Umbrella Programming

Sequential Data Bases—SDB

Sequential Data Base Definition

All sequential files must be defined using an SDB definition, which provides PEM with the DDNAME and physical characteristics of the data base. The definition also indicates which access method or DBMS to use. HOGAN delivers many SDB definitions that may be used in an application program simply by including the DDNAME of a delivered SDB on a DD statement in the program's execution JCL. If you do not want to use any of the delivered SDB definitions, you can add your own definition.

All SDB files are defined as either input or output files. If the data is to be stored on disk or tape, then two SDB definitions will be needed. One definition will provide write access to the storage device, while the second definition will provide read access. An example of these paired SDB definitions are CCTRANS and CCTRANSO, which are used for the Change Control transaction file. Copies of these definitions are on the next page. Notice that they are identical, except that CCTRANS has an INPUT file type and CCTRANSO has an OUTPUT file type.

Notes:

Sequential Database Activities

Sequential data base (SDB) activities permit programs running under Umbrella to access and change data stored in data bases defined as SDB files to PEM. An SDB activity provides PEM with the information about data base name, data group ID, use code, and default action.

The data base name is used as a key by PEM to read the CDMF SDB definition, and to point to the appropriate file within the JCL. The data group ID field supplies PEM with the necessary target data group. PEM must have a data group to use as an I/O area when manipulating a record from a sequential file. SDB definitions do not specify a data group. Different SDB activities for the same data base may specify different target data groups.

There are only two valid options for the use code, either I (input) or O (output). PEM supports the following data base actions against a sequential file:

READ, WRITE, CLOSE, OPENI, OPENO, and NOP.

Sequential databases are comprised of one data group per logical record. Random positioning is not allowed. The data group area, following action and result, is used as a work area for reading and writing these records. Action and result fields are not written to the file. When variable-length records are processed, the standard record descriptor word (LLBB) must be defined in the data group definition after the action and result fields. The application program must set the length value of the record before issuing a write access to the sequential database.

Field TCB-OPTIONS-1 (TCB\$OPT0)

This 1-byte field exists in the User TCB extension Area indicating processing requirements to PEM. Field TCB\$OPT0 allows the program to specify which action to perform if an error occurs.

X'02' (TCB\$ODBN)

Setting a value of hexadecimal two specifies to return all Database Unavailable conditions to the application program. This allows the application to attempt a recovery or circumvention if a database cannot be accessed.

The flag must be set before every applicable database activity. The flag is reset by PEM (to X'00') before returning control to the application.

On the next page are two examples of sequential data base activities that write to the PRINT data base. Notice that the two activities reference different target data groups.

Building an SDB File

Checklist to Build an SDB File

- Define Data Group definition
- Define SDB definition to PEM
- Define SDB activity on Process Dictionary

- OP System requirements: catalog, allocate, initialize file
- Copybook/DSECT
- Execution JCL to reference new data base

© 2001 CSC. All rights reserved

The following steps must be taken to create an SDB file for use in your application program.

1. A data group I/O area must be defined on the Process Dictionary.
2. Define the sequential data base to PEM with an SDB definition.
3. Add SDB activities on Process Dictionary to allow for access against the data base.
4. Catalog, allocate, initialize the file on your operating system.
5. Create a copybook to reflect the data group fields.
6. Modify the execution JCL to reference the new data base.

Notes:

Issuing an SDB Activity

CSC

Issuing an SDB Activity

- **Data Group:** contains action and result fields, and field-defined data area
- **SDB Definition:** provides data base physical definition and indicates access method or DBMS
- **SDB Activity Definition:** supplies data base name, data group ID, and default action code

© 2001 CSC. All rights reserved

The SDB activity function is controlled by three CDMF components. They are the data group, the SDB activity, and the sequential data base definition.

The Data Group: Contains the action and result fields, which are not written to the file, and the field-defined data area.

The SDB Definition: Provides the physical definition of the data base and indicates which access method or DBMS.

The SDB Activity Definition: Supplies the data base name as well as the data group ID, its use code, and default action code.

An SDB activity can be issued from both a PEM transaction and an application program. The default action specified in the SDB activity definition is used to manipulate the sequential file. An application program can override the default action by setting the action field in sequential file's target data group with a valid action code.

Checking Result Fields

CSC

Checking Result Fields

■ After a Data Base Activity

- Check TCB-Result
- Check Data Group Results Fields

© 2001 CSC. All rights reserved

It is the responsibility of the application program issuing the activity to check the result of the action when control is returned to the program. The appropriate result field(s) should be checked to determine the status of the requested activity.

After a data base activity, check TCB-RESULT. If the value is equal to TCB-OK, the DB activity was successful. A value not equal to TCB-OK indicates that some part of the DB activity failed, such as, end-of-data. You must then check the result field of the data group referenced in the data base activity to determine the result of the requested action.

If the result field in the data group is not equal to DGR-OK, the data group's result field will contain the error code that corresponds to those in the delivered data group result code copybook, P49023D.

Problem Specifications—Sequential Database

Sequential Database Exercise I

In this exercise you will define to PEM a sequential output file that will contain employee information. Follow these specifications:

1. The Data Base ID will be EMPxxOUT (where xx is your group number)
2. The access method used is QSAM
3. The disk file is fixed length with an LRECL of 96 bytes

To access the new sequential data base, an SDB activity will need to be defined. Follow these specifications:

1. Use activity ID 9995xx (where xx is your group number)
2. Use the data group ID of 9994xx
3. Processing should continue after this activity is issued
4. Data is to be written using this activity.

Use the owner application and change control created in the Change Control Exercise.

Sequential Database Exercise II

In this exercise you will define to PEM a sequential input file that will contain employee information. Follow these specifications:

1. The Data Base ID will be EMPxxIN (where xx is your group number)
2. The access method used is QSAM
3. The disk file is fixed length with an LRECL of 96 bytes

To access the new sequential data base, an SDB activity will need to be defined. Follow these specifications:

1. Use activity ID 9995yy (where yy is your group number+20)
2. Use the data group ID of 9994xx
3. Processing should continue after this activity is issued
4. Data is to be read using this activity.

Use the owner application and change control created in the Change Control Exercise.

Sequential Database Access Research Exercise

1. For each type of SDB, the USE field for the data groups must be specified on the data base activity. List and explain the uses for each type.

SDB ACTIVITY

2. List the ACTION and RESULT codes below.

ACTIONS	SDB ACTIVITY	RESULTS
---------	--------------	---------

Hierarchical Database—HDB

CSC

Hierarchical Data Base - HDB

- Base Data Group
 - Required
 - Contains all keys
- Positional Data Group
 - 1 per key field value
 - Process sequentially
- Associate Data Group
 - Keyed
 - Multiple occurrence
 - Processing randomly
 - Non-keyed
 - Multiple occurrences
 - Processed sequentially/directly

© 2001 CSC. All rights reserved.

Hierarchical Data Bases are made up of one or more data groups that have a hierarchical relationship, that is, a dependent data group may not exist without an occurrence of its parent. Hierarchical Data Bases may be accessed randomly or sequentially and may be stored and retrieved via several Data Base Management Systems (DBMS). Because PEM creates a logical environment for the application programs, The DBMS used is transparent to the application.

Most data bases used by HOGAN applications are hierarchical data bases. The main distinguishing characteristic of HDBs is that they are keyed and must be defined to PEM as hierarchical, even if they contain only a base data group.

When defining a Hierarchical Data Base to PEM, there are several data group types:

1. BASE DATA GROUP

This type is analogous to a root or base segment in a DL/I structure. The Base Data Group requires a key and may be accessed randomly or sequentially.

2. POSITIONAL DATA GROUP

A Positional Data Group is nonkeyed and can occur once for each occurrence of the base.

3. ASSOCIATE DATA GROUP

Umbrella Programming

Hierarchical Database—HDB

Associate data group may be keyed or nonkeyed. There can be 0 (zero) to n occurrences of an associate for each occurrence of its parent.

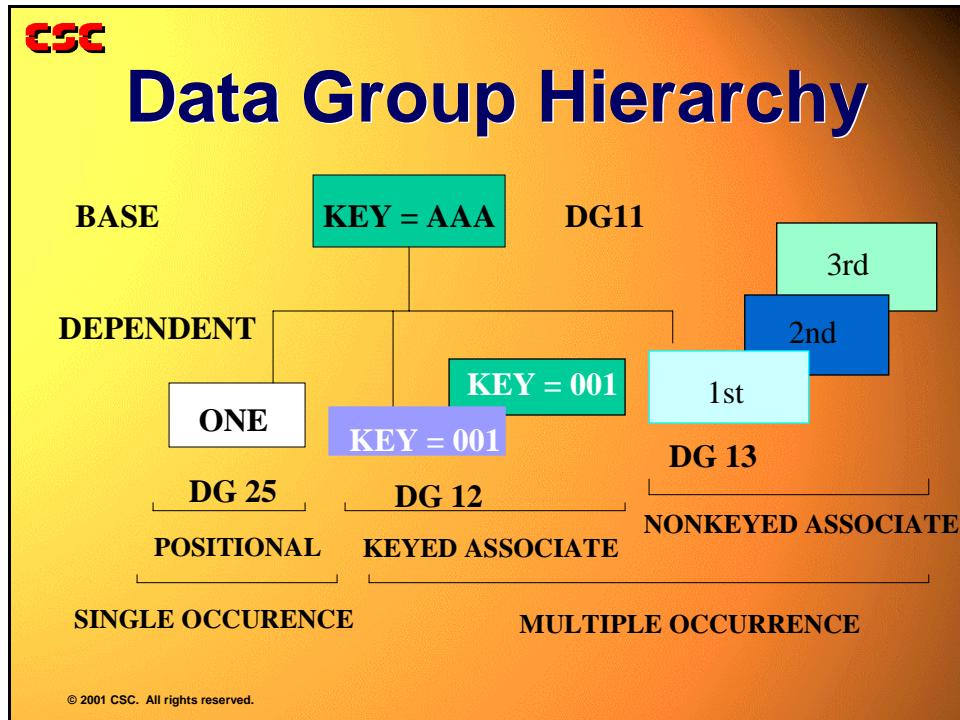

Positional and Associate Data Groups are analogous to dependent segments or physical children in a DL/I structure.

Notes:

Data Group Hierarchy

The following figure illustrates a data group hierarchy.

Notes:

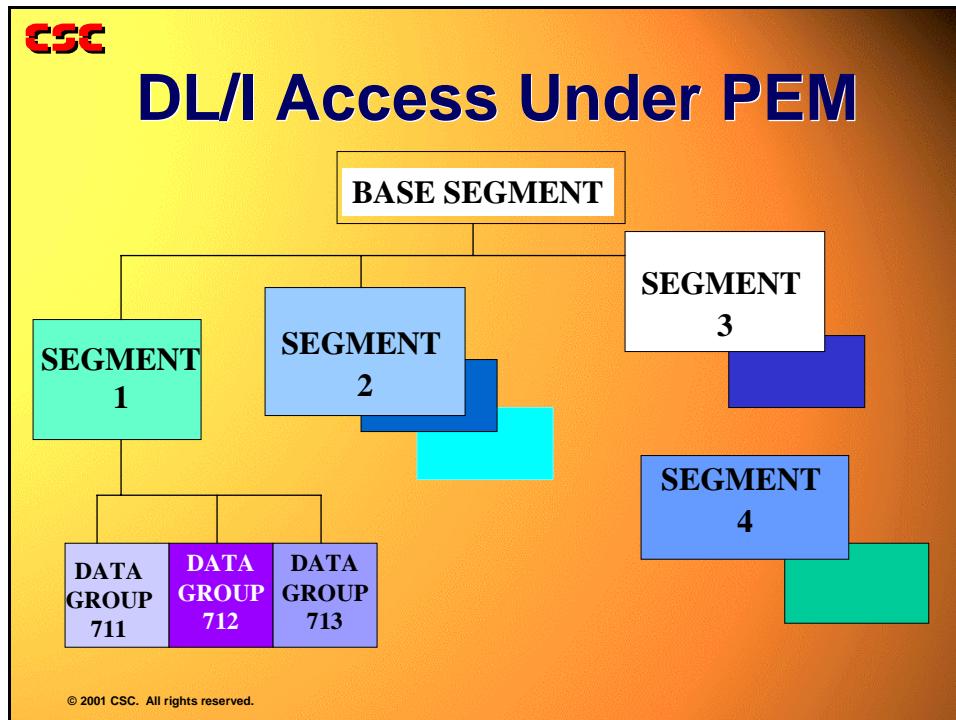

Umbrella Programming

Hierarchical Database—HDB

DL/I Access Under PEM

The following illustrates an example DL/I data base structure and how it could be defined to PEM/Umbrella.

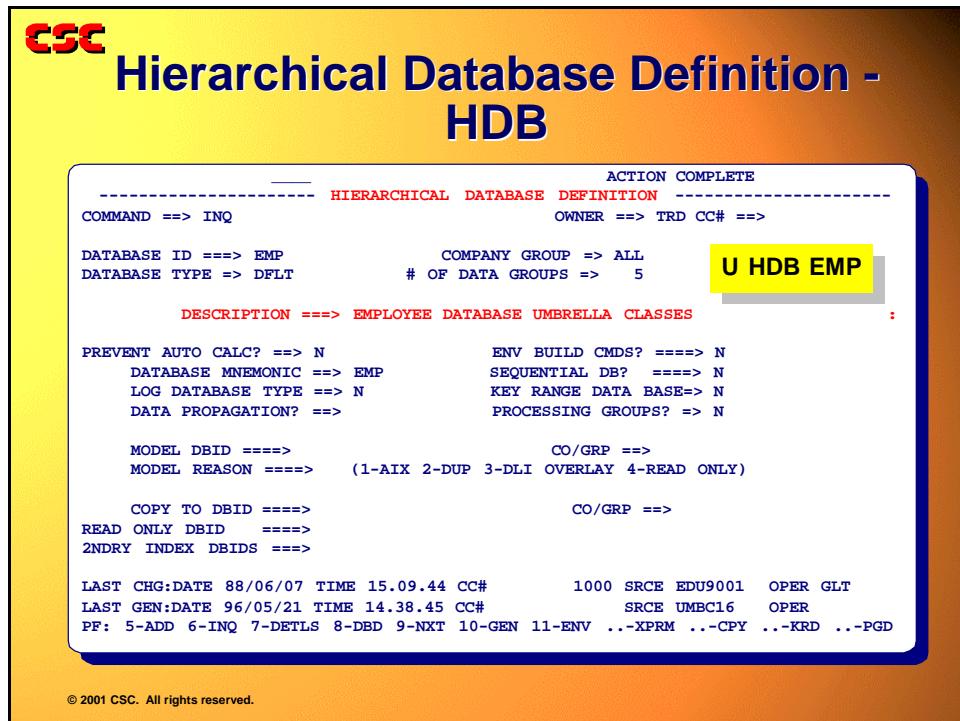

Notes:

Hierarchical Database Definition (HDB)

From a cleared screen, enter U HDB or U 1.5.1 or from the "Umbrella System Process Dictionary Maintenance Menu" select option 5.1 to view the base screen.

To view the Data Base Hierarchy press PF7 or enter DETLS in the COMMAND field.

Notes:

Umbrella Programming

Hierarchical Database Definition (HDB)

Hierarchical Database Hierarchy Definition

This display shows the top to bottom left to right relationship of the Data Groups within the Data Base. The sequence of the Data Groups must be maintained when a Data Base Activity is coded.

The screenshot shows a terminal window with the CSC logo at the top. The title is "Hierarchical Database Hierarchy Definition". The screen displays a table of data group definitions for the EMP database. The table has columns: SEQ, LV, DATA-GROUP, TYPE-, VAR, DESCRIPTION, PARENT, KEY, LOC, and LEN. The data is as follows:

SEQ	LV	DATA-GROUP	TYPE-	VAR	DESCRIPTION	PARENT	KEY	LOC	LEN
1	1	47100	BASE	FIX	EMP DB KEY			4	8
2	2	47110	POS	FIX	EMP DB INFO	47100			
3	2	47130	POS	FIX	EMP DB INFO	47100			
4	2	47140	POS	FIX	EMP DB INFO	47100			
5	2	47120	POS	FIX	EMP DB INFO	47100			

A yellow callout box contains the text: "PF7 or DETLS Command from HDB Base Screen".

* (ACTION)
? - Display Data Group Definition
S - Display Segment Definition

© 2001 CSC. All rights reserved.

To view the data group definition or the segment definition, place the appropriate character under the action (*) field:

- * (ACTION)
- ? - Display Data Group Definition.
- S - Display Segment Definition.

Notes:

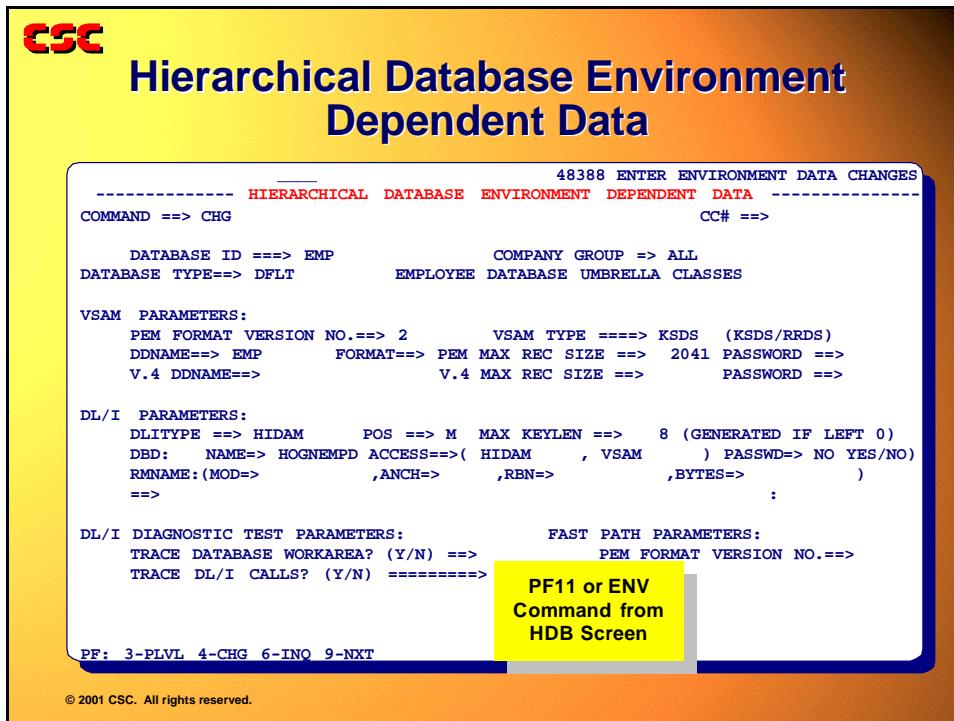

Hierarchical Database Environment Dependent Data

To view the Hierarchical Data Base Environment Dependent data:

- Press PF11
- or
- Enter ENV in the COMMAND field

from the HDB Base Screen.

This display is used to tie the logical environment to the real environment. It is used to establish the Data Base as VSAM or DL/I.

Notes:

Umbrella Programming

Hierarchical Database Definition (HDB)

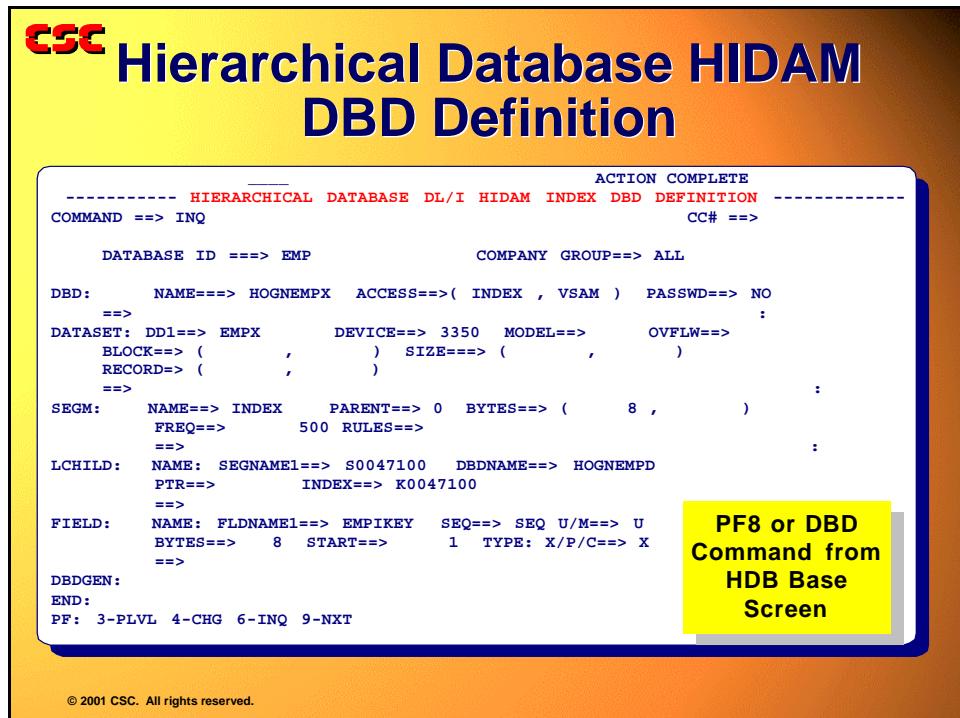

Hierarchical Database HIDAM DBD Definition

To view the Hierarchical Data Base HIDAM DBD Definition:

- Press PF8
- or
- Enter **DBD** into the COMMAND field

from the HDB Base Screen.

This display is used to define the index for a Hierarchical Index Direct Access Method Data Base (HIDAM). The information is used to create the HIDAM DBD source statements.

Notes:

How PEM Uses Data Bases

Data Base Access Management

Data bases are defined to the Process Dictionary. The definitions provide not only information about the physical access of the data base but also the logical structure of the data base records. This logical structure is indicated by listing the data groups residing on the record and the relationship among them. A data group defines a contiguous group of logically related elements in a physical record.

A COBOL program accesses the data through work areas or data groups that are in the linkage section of the program. The program instructs PEM to access a data base through an activity. The coded statements required are similar to

```
MOVE activity-name TO TCB-LONG-ACTIVITY.  
CALL 'PEM' USING TRANSACTION-CONTROL-BLOCK.
```

A record key is not required during sequential processing. It is required for random access. The user can set the key fields in the application program or instruct PEM to deblock them.

Physical Data Base Definitions

The data structures supported under PEM include VSAM, DL/I, IMS, and IMS Fast Path. A data base is defined physically under one of these structures.

There is nothing magical about the manner in which the data bases are physically accessed. Normal processing occurs. The magic is that PEM handles the actual access. In order to do so, there are different and additional requirements for the application programmer and data base administrator. They must communicate to PEM information about the access desired.

Notes:

Umbrella Programming

How PEM Uses Data Bases

Hierarchical VSAM Management

PEM provides the VSAM user a new way in which to develop VSAM systems and view data stored in native VSAM structures. PEM allows the user to create a hierarchical structure that is physically stored in a flat file. A variable length VSAM record in effect becomes a root segment with dependent segment(s) of the hierarchy.

At execution time, PEM references a control block referred to as the data base work area (DBWA). The DBWA establishes addressability to data groups within the hierarchical definition. PEM furthermore handles positioning for the application. The application itself simply requests data and remains unconcerned with physical structure.

VSAM efficiency is enhanced by PEM's own data management facilities. When an application instructs PEM to write a data group, the associated data is updated in the output buffer. PEM does not actually write the record until the PEM transaction ends, the user requests an end, or a subsequent read requires a refresh or repositioning.

When a request to read a data group is issued, PEM first attempts to locate the logical record in existing buffers.

IMS Data Base Management

PEM insulates the application program from the physical data structure. Consider IMS as an example. Application programmers do not need to know or understand IMS call structure syntax or definition, maintenance, and utilization of Program Control Blocks or Segment Search Arguments. Data Base Definitions and Program Specification Blocks are still required as PEM maintains a native IMS environment. PEM simply shields the application from the physical data structure.

Notes:

Hierarchical Database Activities

Hierarchical Data Base activities access Hierarchical Data Bases. Hierarchical Data Bases differ from Sequential Data Bases because they can be composed of more than one data group, they can be accessed randomly, and some Data Groups can have a logical dependent relationship to other Data Groups. Please review the chapter on Data Groups and Data Bases for a discussion of the types of Data Groups that can be defined in a Hierarchical Data Base.

A Hierarchical Data Base Activity can access one or all of the Data Groups listed on the Hierarchical Data Base Definition. The Base Data Group must always be accessed. Because of the method used by PEM to retrieve the individual Data Groups on the data base, the order in which the Data Groups are listed on the Data Base Activity must match the order in which they are listed on the Data Base Definition.

Each data group in a Data Base Activity has a USE CODE and a DFLT ACTION. The following types of access may be specified in the use code.

SEQUENTIAL INPUT (USE CODE "I")

Data will be retrieved in a sequential manner. Where possible, the data base system will be told to anticipate a request for the next unit of data and should manage the I/O buffers accordingly. Output actions are not valid for this use code.

SEQUENTIAL OUTPUT (UPDATE) (USE CODE "O")

I/O buffers are to be managed as in the sequential input use code. The difference is both input and output actions may be used.

RANDOM INPUT (USE CODE "R")

Data is retrieved based on the value of the key field in the data group. No anticipatory buffering is done. Sequential actions and output actions are invalid.

RANDOM UPDATE (USE CODE "U")

Similar to random input except that random output actions may also be used.

The Action code may be placed in the Data Group Action Field by the application program, or the Activity Definition may contain DEFAULT Action Codes. These action codes, along with the use code for the data group in the Activity Definition, tell PEM which operations to perform so that the appropriate request may be made to the Data Base Management System.

Notes:

Umbrella Programming

How PEM Uses Data Bases

Not all USE and ACTION CODES are valid for all types of Data Groups. For example, POSITIONAL Data Groups can only be accessed sequentially because they are not keyed. BASE Data Groups, however, can always be accessed randomly because they are always keyed. Because of the different characteristics of the data groups within a data base, you may find that when you create a data base activity, not all of the data groups listed on the activity will have the same use and action codes.

An example of a Hierarchical Data Base Activity with different USE and ACTION Codes follows.

The screenshot shows a CSC application window titled "HDB Activity 47020". The window displays the following information:

Rule of Accessability

Process Dictionary Requirements

- Data Groups Definitions
- HDB Definition
- HDB Activity Definition

© 2001 CSC. All rights reserved.

The data base activity is the mechanism to access hierarchical data bases. They are usually issued from an application program.

Actually, there are three types of entries on the Process Dictionary required for a successful access. These are:

DATA GROUPS Contain data, action, and result.

DATA BASE DEFINITIONS Provide the definition of the data base, the access method or DBMS to be used, and the valid data groups and hierarchical dependencies for hierarchical data bases.

DATA BASE ACTIVITIES Supply the ID of the data base as well as a list of data group to be accessed, use codes, and default action codes.

Notes:

HDB Rule of Accessability

HDB Rule of Accessibility

The order of the Data Groups on the HDB Activity MUST MATCH the order of the Data Groups on the HDB Definition.

© 2001 CSC. All rights reserved.

Notes:

Checking Result Fields

Check Result Fields

- After a Data Base Activity
 - Check TCB - Result
 - Check Data Group Result Fields

© 2001 CSC. All rights reserved.

It is the responsibility of the application program issuing the activity to check the result of the action when control is returned to the program. The appropriate result field(s) should be checked to determine the status of the requested activity.

After a data base activity, check TCB-RESULT. If it is equal to TCB-OK, the DB activity was successful. A not equal to TCB-OK indicates that some part of the DB activity failed, such as, end-of-data. You must then check the result field of the data groups referenced in the data base activity to determine the result to the requested action.

If the result field in the base data group or any dependent data group is not equal to DGR-OK, the data group's result field will contain the error code that corresponds to those in the delivered data group result code copybook.

Notes:

RESULTS

Umbrella Programming

How PEM Uses Data Bases

3. Go to the Process Dictionary and find the data base definition for the hierarchical data base, EMP.

- How many data groups in this data base?

-
- What is the base data group?

-
- Which field(s) make up the key to this data base?

-
- List the dependent data groups and the type for each.

4. Draw the data group relationship for the EMP Data Base.

Umbrella Programming

Problem Specifications—HDB Activity

Problem Specifications—HDB Activity

You are to add an HDB activity to read the EMP data base.

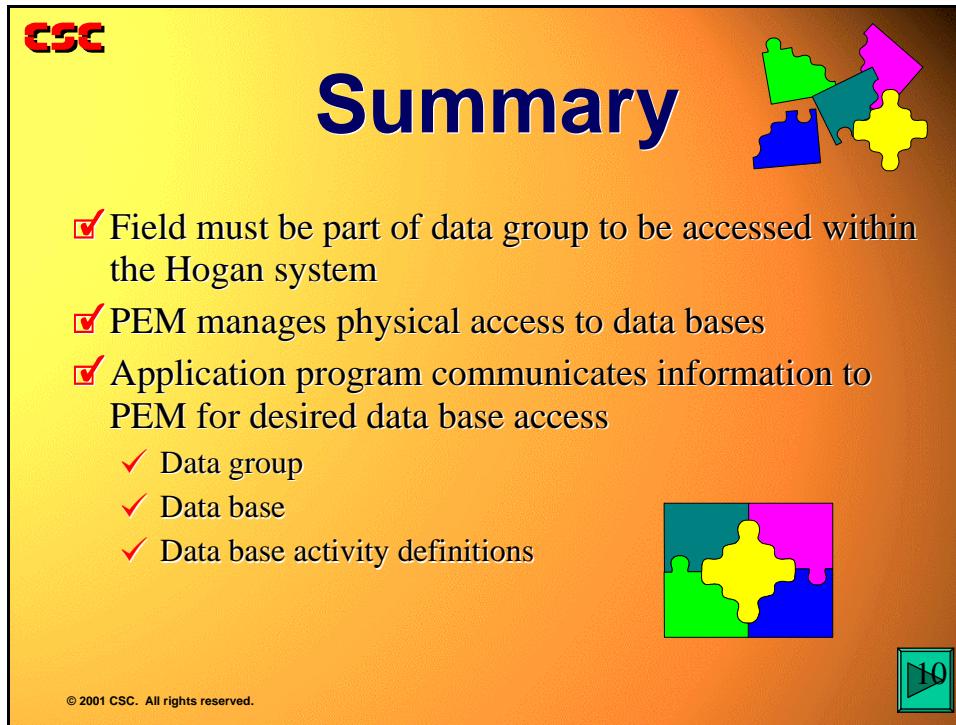

Follow these specifications:

1. Use activity number 9996xx, where xx is your group number.
2. Access is random.
3. All data groups defined in EMP, except 47110, are needed for this read.
4. Processing should continue after this activity is issued.
5. EMP has no secondary key.
6. Use the owner application and change control created in the Change Control Exercise.

Notes:

Summary

The slide features a yellow background with a red CSC logo in the top-left corner. In the top-right corner, there is a graphic of four interlocking puzzle pieces in green, pink, blue, and yellow. At the bottom left, there is a small text "© 2001 CSC. All rights reserved." and at the bottom right, a small icon of a person with a speech bubble.

Summary

- ✓ Field must be part of data group to be accessed within the Hogan system
- ✓ PEM manages physical access to data bases
- ✓ Application program communicates information to PEM for desired data base access
 - ✓ Data group
 - ✓ Data base
 - ✓ Data base activity definitions

- A field has to be part of a data group for it to be accessed within the Hogan system.
- PEM manages the physical access to data bases.
- PEM provides for a hierarchical view of a VSAM data base.
- The application program communicates to PEM the information needed for a desired data base access. It does so through data group, data base, and data base activity definitions.
- Hierarchical data bases are logically defined by one or more data groups. There must be a base data group that contains the record key.
- An HDB in a VSAM environment can have a PEM format or a FIXED format.
- Information about the DL/I DBD and segments can be obtained from the HDB definition on the Process Dictionary.

Objectives

CSC

Objectives

- Identify fields on program definition
- Describe how control is passed among program running under PEM
- Describe how addressability to data groups is established
- Name the UTCB and list some important fields
- Describe how activities are authorized and executed
- Define halfword and fullword technology

© 2001 CSC. All rights reserved.

Program Definition

All application programs that run in the PEM logical environment must be defined in the Process Dictionary. In each Program Definition entry the Load Module ID, language, data groups used, and activities used are listed.

To display a Program Definition:

Enter **U PGM** from a cleared screen followed by either the Program ID or Linkname.

```
U PGM 8108
or
U PGM I37008
```

It is also possible to jump to a Program Definition. Entering either of the following commands will take you to the Program Definition for program ID 8108.

```
COMMAND ==> =1.3.8108
or
COMMAND ==> =PGM 8108
or
COMMAND ==> =PGM I37008
```

Notes:

Program Execution

Program Execution

Requires a:

- Link Activity
- Executes as sub-program to PEM
- Data Groups are passed as parameters via standard linkage convention
- Activities must be authorized

© 2001 CSC. All rights reserved.

An application program is executed only as the result of a requesting link activity. This activity may be one in the transaction's definition, or it may be requested by another application program. From whichever source the link activity is issued, the program definition indicates to PEM the load module name containing the program to be executed.

PEM executes application programs as called subprograms. Before an application program is executed, PEM allocates the space for all of the data groups referenced on the Program Definition. The data groups are passed, as parameters, to the application program in the same order as they are defined by the Program Definition. For COBOL programs, each data group corresponds to an 01 level statement in the linkage section. For ALC programs, register one points to a list of fullwords. Each word contains the address of a data group with the high-order bit ON of the last word.

Notes:

Establishing Addressability

Data Usage

All application programs in the Hogan systems are called programs. PEM is the calling program and handles the establishment of addressability to the data. It requires that the order of the data groups correspond in three places:

CSC

Establishing Addressability

- Program Definition
- Linkage Section
- Procedure Division Using Statement
- Rule of Addressability:
 - The order of the Data Groups on the Program Definition **MUST MATCH** the order of DataGroup Copybooks in the Linkage Section, **MUST MATCH** the order of 01 Level Names listed in the Using Statement

© 2001 CSC. All rights reserved.

PEM's TCB is always the first data group for which addressability is established (parameter is passed).

Notes:

Umbrella Programming

The User Transaction Control Block

The User Transaction Control Block

PEM also passes a control block known as the User Transaction Control Block (UTCB). This is always the first parameter passed to the program. The UTCB is used by PEM to communicate to an application program the information pertinent to the current processing. Data such as the Transaction ID, the date and time PEM received the transaction, the source of the transaction, and so on is provided for the application program. The UTCB also contains fields that the application program uses to communicate with PEM.

Notes:

Activity Execution

csc

Activity Execution

- Activity is a unit of work
- Move Activity ID to TCB-LONG-ACTIVITY
- Call ‘PEM’ using TRANSACTION-CONTROL-BLOCK

© 2001 CSC. All rights reserved.

Much of the work of the application program is performed by activities. An important function of the Program Definition is to indicate to PEM which activities the program is authorized to request.

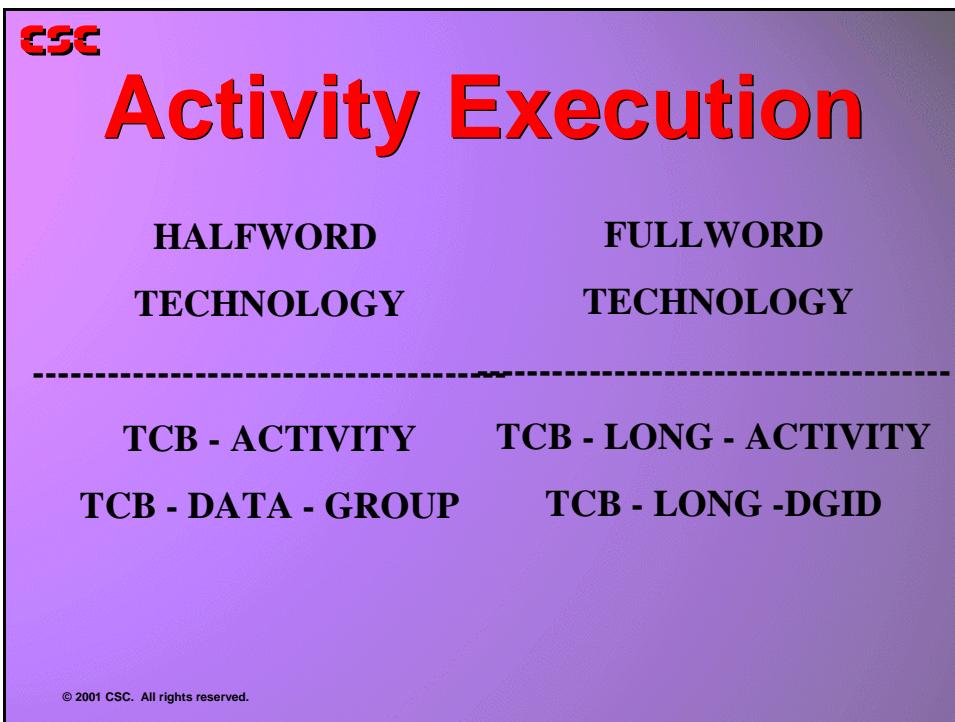

The application program requests a specific activity by placing the number of the activity ID in the User Transaction Control Block prior to calling PEM. PEM uses the activity ID as a key into the Process Dictionary. The Activity Definition tells PEM what must be done to satisfy the request. Following the execution of the activity, control usually returns to the application program, which can resume processing from the point at which the activity was issued.

Program Definitions indicate whether the program uses halfword technology or fullword. Different fields are used in the TCB depending on this indicator as follows:

Umbrella Programming

Activity Execution

The slide features a red CSC logo in the top-left corner. The title 'Activity Execution' is prominently displayed in large red letters. Below the title, there are two columns of text: 'HALFWORD TECHNOLOGY' on the left and 'FULLWORD TECHNOLOGY' on the right, separated by a horizontal dashed line. Underneath this line, there are four more items: 'TCB - ACTIVITY', 'TCB - LONG - ACTIVITY', 'TCB - DATA - GROUP', and 'TCB - LONG - DGID'. At the bottom left, a small note reads '© 2001 CSC. All rights reserved.'

HALFWORD TECHNOLOGY

FULLWORD TECHNOLOGY

TCB - ACTIVITY TCB - LONG - ACTIVITY

TCB - DATA - GROUP TCB - LONG - DGID

© 2001 CSC. All rights reserved.

Programs developed before the CDMF version of Umbrella use halfword technology.

While support for halfword programs is to be phased out over future releases, Umbrella System Version 3 Release 0 CST 1 allows existing halfword programs to execute fullword activities. This specifically supports Procedure Division copybooks written to use fullwords and be included in both existing halfword and fullword programs.

Notes:

Problem Specification—Program Definition

Build a Program Definition for program ID 9994xx (where xx is your group number).

1. The program is fullword.
2. The program is coded in COBOL.
3. The linkname is Z9994xx.
4. Enter a description that includes your group number.
5. The program refers to the following Data Groups:

TRANSACTION CONTROL BLOCK	1
DATE CONTROL BLOCK	2000
EMP DATA BASE DATA GROUP	47100
EMP DATA BASE DATA GROUP	47110
EMP DATA BASE DATA GROUP	47130

6. The following activities need to be authorized for use by this program.
 - 9996xx, where xx is your group number.
 - 1900
7. The program's current status is test.
8. The program will be of low usage.
9. The program may be used both in online and batch.
10. Use the owner application and change control created in the Change Control Exercise.

Notes:

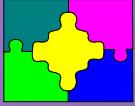

Summary

Summary

- ✓ Information such as linkname, data groups used in the program, and authorized activities must be specified using a program definition in defining programs to PEM.
- ✓ Data groups are passed as parameters to the application program based on the program definition.
- ✓ The User Transaction Control Block (UTCB) is also passed to the application program. It passes information between the application program and PEM.

Transaction Definition

A transaction contains one or more activities that perform a complete unit of work. In data processing, the word transaction usually conjures up thoughts of online work. Typically there is a direct correspondence between an online system's identification of a transaction and PEM's identification of a transaction. In a batch environment, usually there is one PEM transaction definition but thousands of application input data transactions. A batch PEM transaction is analogous to a batch job step or batch execution.

PEM transactions are defined in the Process Dictionary and keyed by application, function, source type, company and effective date. Each Transaction Definition contains a list of Activity Definition IDs. The activities are executed in the order specified on the transaction definition. The transaction definition is the master execution driver for the process. A transaction definition may contain one to many activity IDs. An activity ID may be a link to a program that issues other activities. An end program activity will cause PEM to return control to the transaction definition. After the last activity on the transaction definition is executed, the transaction is ended.

Operating Environment Interface

Environment Dependent Considerations

Environment Dependent Considerations

- PEM transactions originally defined and executed in operating environment
- Responsibilities of operating environment are:
 - Start PEM execution
 - Pass information allowing location of transaction definition

© 2001 CSC. All rights reserved.

All PEM transactions must originally be defined and executed in an operating environment. The responsibilities of the operating environment are to start the execution of PEM and to pass enough information to PEM to allow the transaction definition to be located on the Process Dictionary. In many cases a user exit is also necessary to provide fields (Company ID and source type) that are keys to transaction definitions.

The source type field allows different versions of a transaction to be executed from different environments; for example, a transaction executed online might have a display activity. The same transaction executed in batch would not issue display activities. A transaction executed from a manned teller machine would have still a different source type and would require still another transaction definition.

Notes:

Listed below is a summary of how different environments obtain the transaction definition key.

Obtaining the Transaction Definition Key

BATCH

SYSIN card has CO/APP/FUNC. Source type is always 4

CICS/VS, IMS/DC

The Process Dictionary is read with the transaction code as the key to obtain the application code and the function ID. The user exit supplies the company and source type.

Notes:

Umbrella Programming

Transaction Definition

Execution Under Different Environments

Application programs written under PEM may run in several operating system environments or be migrated from one to another.

Data bases may be defined to VSAM or IMS.

Teleprocessing monitors may be CICS or IMS DC.

Whatever the environment, the application program can be executed without modification.

This flexibility is possible because Hogan can tailor PEM for the target environment. PEM modules are structured as macros with parameters that are used in conditional assembly statements to govern which environment the assembly will support. This collection of modules is then link-edited into a single load module per environment. Environments that are preassembled and distributed with each release are:

Execution Under Different Environments

BATCHPEM	-	OS/MVS, XA, ESA, VSAM, BATCH
CICSPEM	-	OS/MVS, XA, ESA, VSAM, CICS/VIS
DLIPEM	-	OS/MVS, DL/I, BATCH
BMPPEM	-	OS/MVS, IMS/VIS, BMP
IMSPEM	-	OS/MVS, IMS/DB-DC
IMSPEMF	-	OS/MVS, IMS/VIS FAST PATH

© 2001 CSC. All rights reserved.

All application programs execute as called subprograms to PEM. They never interface directly with the operating environment. Instead, they make requests of PEM by issuing activities. PEM actually executes the activities, thereby accessing a data base, allocating storage, or performing some other function with the operating environment.

PEM/Operating Environment Interfaces

A unique PEM interface module is generated for each processing environment. PEM is always the first program executed by the processing environment. PEM will, in turn, execute the application programs.

This interface also establishes the PEM Transaction ID. The PEM Transaction ID is made up of the following five numeric fields.

CSC

Environment Interfaces *Key Fields*

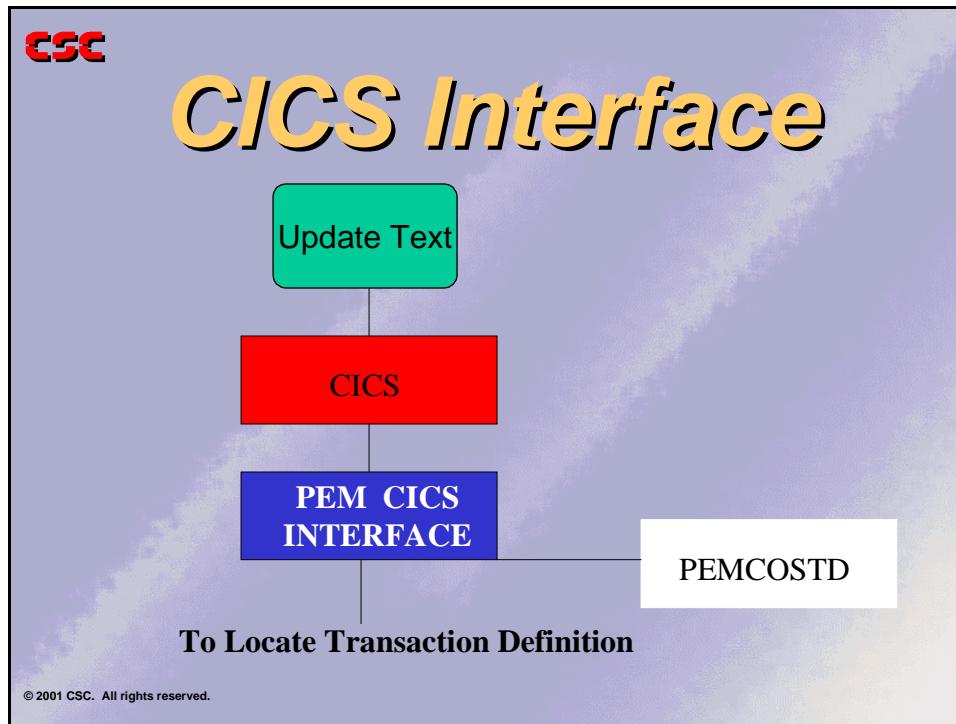

Company Number	range	1 - 65534
65535	= Default	
Application Number	range	1 - 65535
Function Number	range	1 - 65535
Source Type	assigned by PEM	
Effective Date	assigned by user	

© 2001 CSC. All rights reserved.

Notes:

CICS Interface

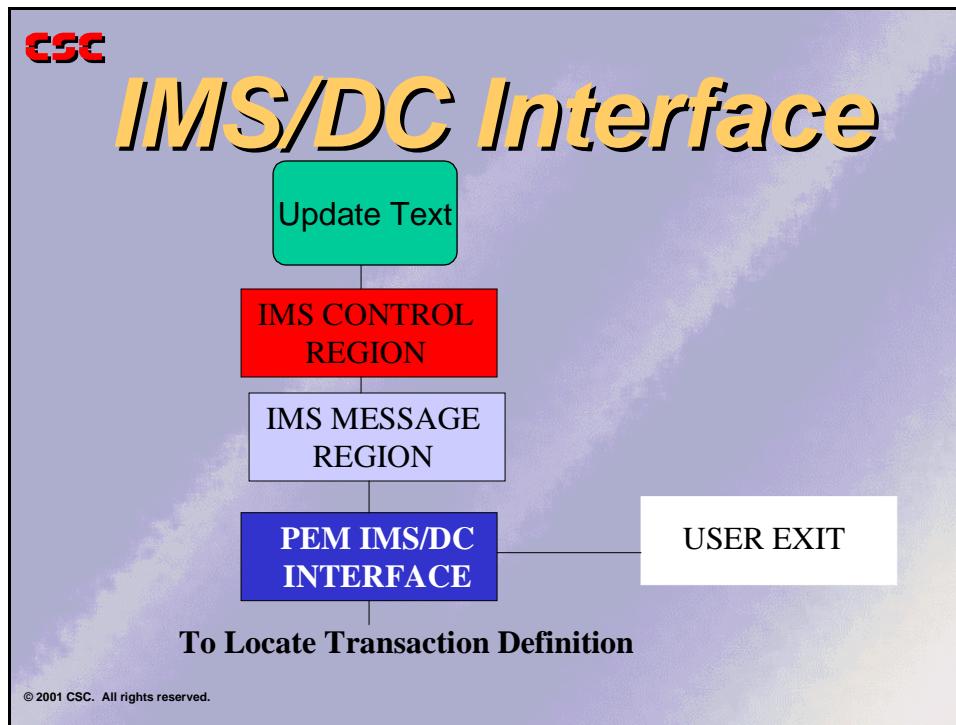

Terminal input is read by CICS. This input must contain a transaction code as prescribed by CICS. The PCT (Program Control Table) must specify the load module name of the PEM CICS interface for all transactions processed by PEM application programs. The PEM CICS interface program cross-references to the PEM application number and function number. The PEM company number and source type are set by a user-prepared exit. The exit program name is *PEMCOSTD*.

Notes:

IMS/DC Interface

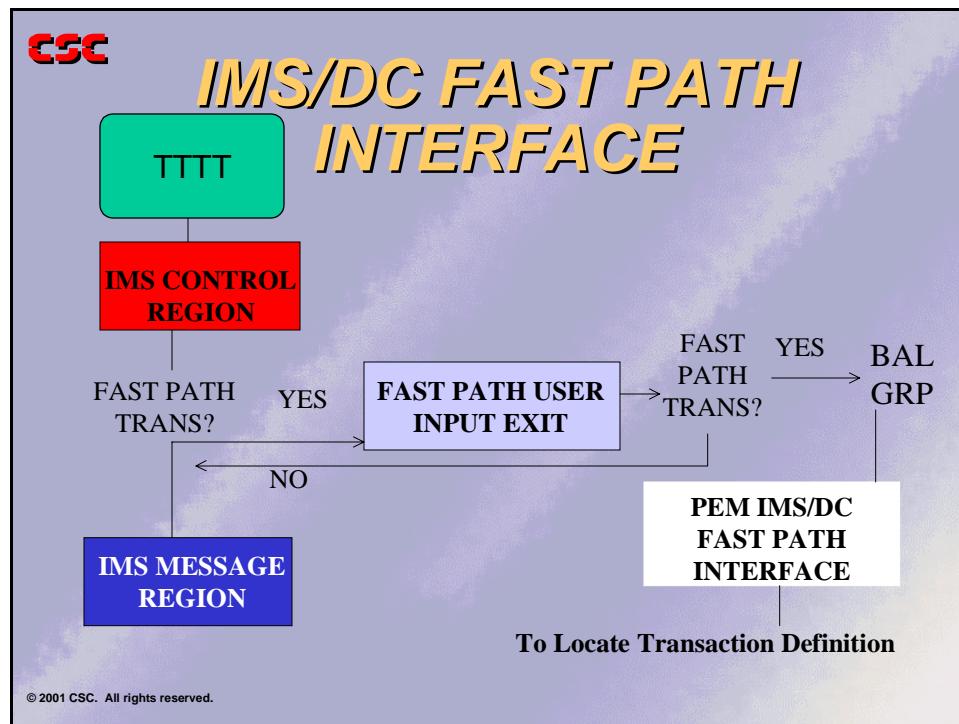

The terminal input is read by the IMS control region and placed on the appropriate message queue. The control region then dispatches the appropriate message processing region. The PSB name for all transactions processed by PEM application programs must be the name of the load module for the PEM IMS/DC interface. Because several PSBs may be required, this module must be link edited with an alias for each PSB. The PEM IMS/DC interface program cross-references to the PEM application number and function number. The PEM company number and source type are set by a user-prepared exit program. The exit program is described in the *Umbrella System Technical Support Programming Guide*. The exit program name is PEMCOSTD.

The PEM IMS/DC interface actually consists of two modules. The first is a simple routine that is to be preloaded by IMS. This is the module whose name must match the PSB name. This module, on the first execution, loads the remainder of PEM and saves the address. On subsequent executions, direct branching to PEM is used. This is to eliminate the overhead associated with initializing PEM.

IMS/DC Fast Path Interface

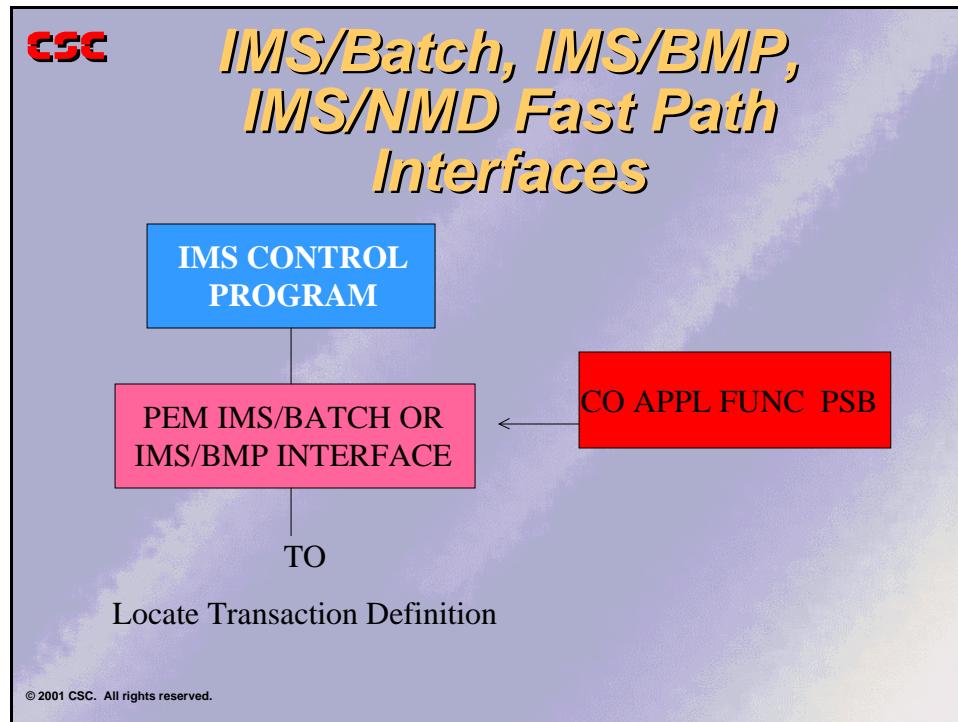

The IMS/VS control region routes all Fast Path exclusive transactions and Fast Path potential transactions to a required Fast Path user input exit. This module then routes the transaction to a Fast Path balancing group, sends it back to IMS/VS for processing, or the exit can cancel the transaction. The Fast Path user input exit is not provided as a part of the PEM Fast Path extension. The Fast Path balancing groups then send the transactions to the PEM IMS/DC interface. Fast Path and non Fast Path transactions use the same PEM interface but in different regions. The PEM Process Dictionary data bases cannot be Fast Path data bases. Therefore, any transaction presented to PEM may run mixed-mode. PEM caches the Process Dictionary definitions as they are retrieved from the data bases. Subsequent occurrences of transactions usually do not require access of the data bases and do not run mixed-mode. PEM also provides a means of caching dictionary definitions before the transaction is presented.

Notes:

IMS/Batch, IMS/BMP, and IMS/NMD Fast Path Interfaces

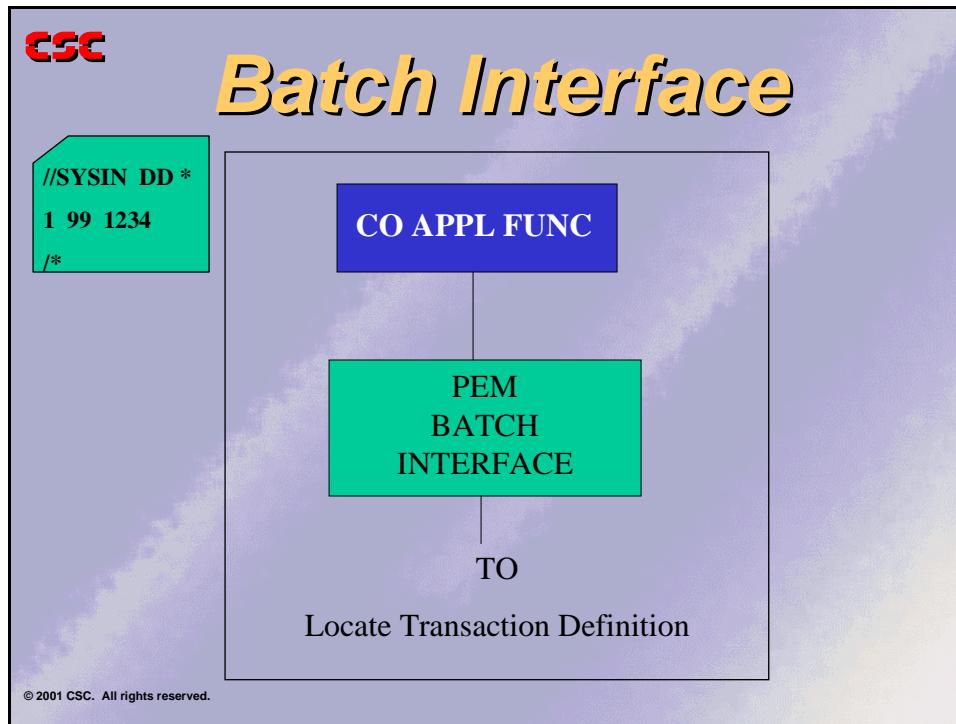

The program ID specified in the PARM= parameter of the execute statement is the Load Module ID for either the PEM IMS/BATCH interface or the PEM IMS/BMP interface. Once IMS gives control to PEM, processing is as described for the PEM batch interface.

Notes:

Batch Interface

The program ID specified in a batch execute statement is the Load Module ID for the PEM batch interface. This program reads SYSIN for a Transaction ID record. This record signifies the start of a PEM transaction. There may be any number of Transaction ID records on SYSIN. SYSIN is read each time a PEM transaction ends. PEM goes to end of job when an end of data condition is reached on SYSIN.

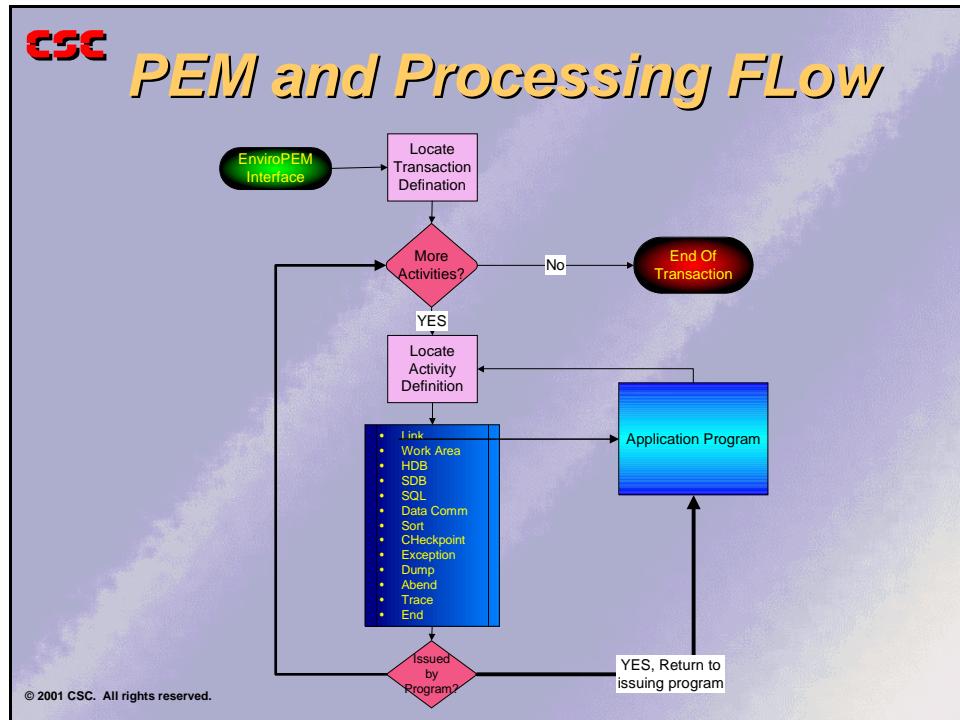

The Transaction ID record must contain three fields. The fields may be entered anywhere from column 1 through column 20. Each field may be delimited by a blank, a comma, or a slash. The first field must contain the company number, the second field must contain the application number, and the third field must contain the function number of a PEM transaction. Because the source type for batch is always 4, PEM supplies this field.

```
//SYSIN DD *
 1 99 1234
/*
```

Processing Flow

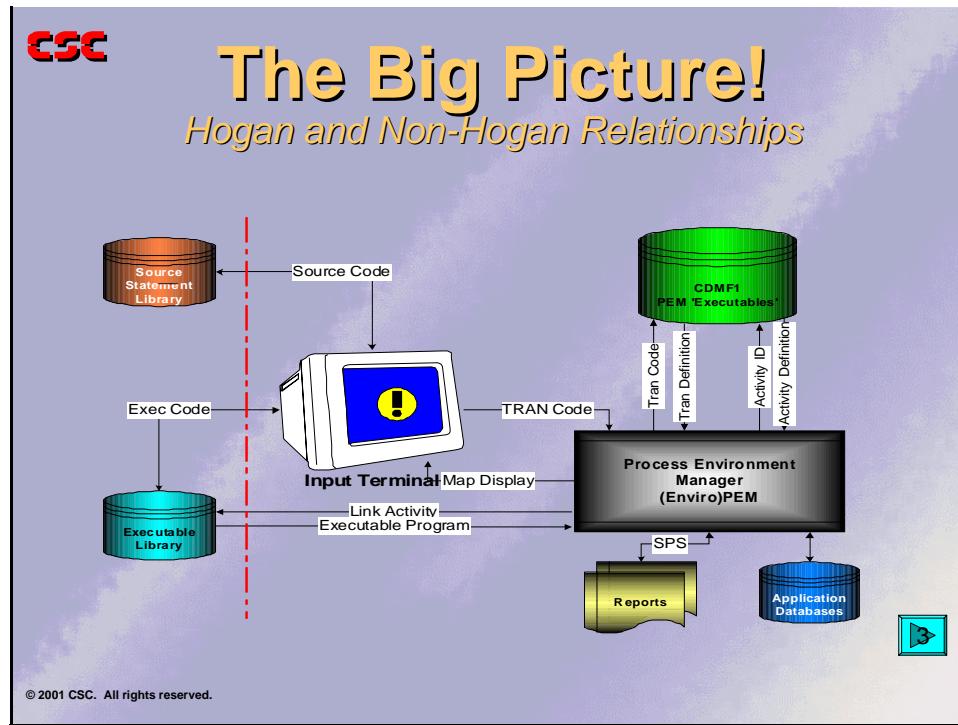

This section describes the processing flow from the time PEM receives a transaction through all of the activities until the processing is completed. Keep in mind that each environment has its own way of obtaining the transaction definition key, but, once this has been done, the flow within the transaction and within the application programs is the same.

Notes:

The Big Picture Revisited

Notes:

Problem Specifications—Batch Transaction Definition

You are to create a batch transaction definition, which will issue a link activity to invoke your program 9994xx.

Key for the batch PEM transaction definition:

APPLICATION ID	99
FUNCTION	99xx where xx is your group number
SOURCE	4
COMPANY	ALL
EFFECTIVE DATE	780101

The Activity Definition 9994xx, where xx is your group number, to link to your program was created in a prior exercise.

Use the owner application and change control created in the Change Control Exercise.

Notes:

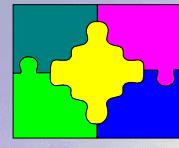

Summary

CSC

Summary

- When PEM is executing in batch, the PEM transaction to be processed is identified by a SYSIN DD card.
- When PEM is executing online, the PEM transaction to be processed is identified through the conversion of a CICS or IMS trancode.

Programming Considerations

Program Invocation

CSC

Program Considerations

- = Program Invocation
 - = Run as subprograms to PEM
 - = Link Activity
- = Data Addressability
 - = Program Definition
 - = Linkage Section
 - = Using Statement

© 2001 CSC. All rights reserved

All programs in the Hogan System run as subroutines to PEM. PEM is the calling program. When writing a program to run under PEM, you are writing a subroutine and always using data areas managed and passed to you by PEM.

Each application program in the Hogan environment is executed as the result of a Link Activity issued either from the Transaction Definition or from another program. Control passes to PEM, which then passes control to the desired program.

Notes:

Data Addressability

Under standard COBOL linkage, conventions exist so that the compiler can maintain addressability to data. When a program calls a subroutine, the order of the data areas on the CALL statement must be the same as the order of the data areas in the USING clause of the procedure division statement of the called program.

As the calling program, PEM follows this standard; however, some modifications have been made in order to improve response and utilize the structure of the Process Dictionary to maintain parameters. The data areas in the COBOL program correspond to data groups on the Process Dictionary. You might think of PEM's formatting the CALL statement for the program based on the parameters from the program's definition on the Process Dictionary.

CSC

Before Executing, PEM:

- ◆ Allocates storage for data groups
- ◆ Establishes or passes addressability of data groups to the program
- ◆ Requires order of data groups correspond to COBOL programs in:
 - Program definition on the Process Dictionary
 - Linkage Section
 - 01 levels listed on the Procedure Division using statement

* 01 Assumed

© 2001 CSC. All rights reserved

Before the called program begins executing, PEM does the following:

1. Allocates storage for data groups to be used by the program as listed on the program definition. Data groups that have already been allocated for programs executed before this one are not allocated again. The current program is simply given addressability to the data groups.
2. Establishes or passes addressability of the data groups to the program. For COBOL programs, this requires an 01 level statement in the linkage section for each data group to be used. For ALC programs, register one points to a list of fullwords. Each contains the address of a data group.
3. Because PEM handles the establishment of addressability to the data, it

Umbrella Programming

Programming Considerations

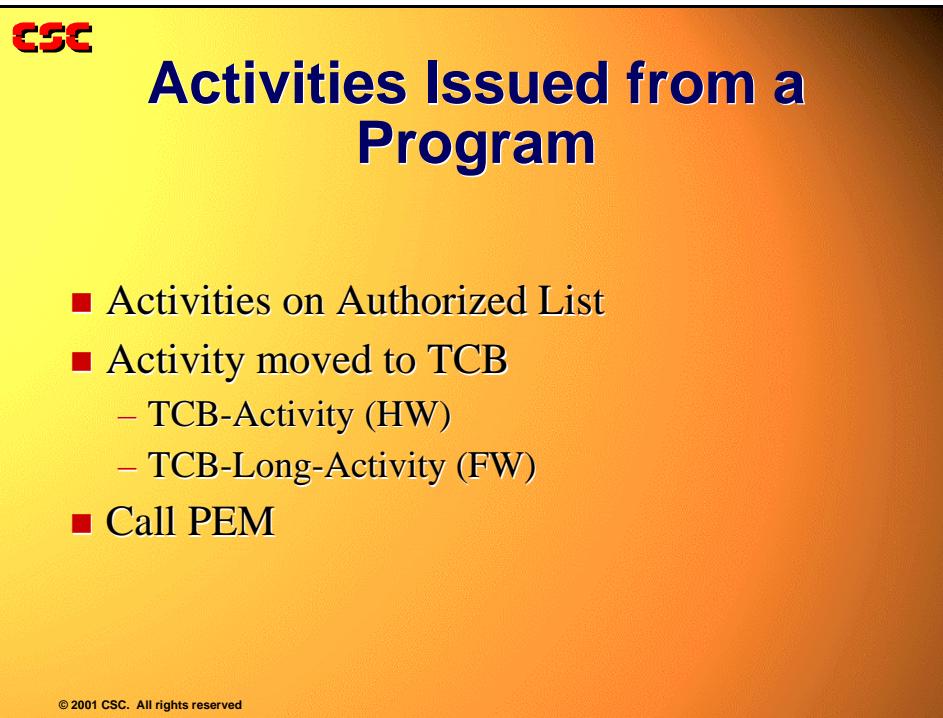

requires that the order of the data groups correspond in three places in COBOL programs:

- Program definition on the Process Dictionary
- Linkage Section
- 01 levels listed on the Procedure Division using statement.

PEM's TCB is always the first data group for which addressability is established.

**Note: THE TCB IS NEVER LISTED ON A PROGRAM DEFINITION.
ADDRESSABILITY WILL BE PROVIDED BY DEFAULT.**

Activities Issued From a Program

The slide has a yellow-to-orange gradient background. In the top left corner is the red CSC logo. The title 'Activities Issued from a Program' is centered in large blue text. Below the title is a bulleted list of activities:

- Activities on Authorized List
- Activity moved to TCB
 - TCB-Activity (HW)
 - TCB-Long-Activity (FW)
- Call PEM

At the bottom left of the slide, there is a small copyright notice: © 2001 CSC. All rights reserved.

PEM establishes the list of activities the program is authorized to issue by reading the program definition form CDMF1. The program may or may not use all of the activities during any one execution.

The program cannot, however, issue an activity request if it is not on the program definition with the exception of activity IDs 100 or less. These activities are the PEM common activities and COBOL copybook P49003D is delivered with these activity numbers predefined. All programs are authorized to issue activities 1 through 100 without listing them on the program definition.

Working Storage—Static Values

CSC

Working Storage - Static Values

- Hogan's use of binary values
 - Client-reserved ranges
 - 50,000 - 100,000
 - 50 million - 100 million
- Halfword and fullword fields
 - Activity ID
 - Format ID
 - Condition Codes
 - Action Copybook
 - Result Copybook

© 2001 CSC. All rights reserved

In some CICS environments, which can have multiple transactions processing simultaneously, only one copy of working storage is generated. In this environment, the working storage data must stay unchanged. Because Hogan programs must run in all environments, they are delivered with only constants defined in working storage.

Many of the codes and values that will remain constant throughout processing are defined in delivered copybooks. The data elements contain static values for such fields as actions and results. The use of the standardized data element names in Hogan subroutines assists programmers in becoming familiar with the function of programs rapidly.

An action field tag name from the data group action copybook will be moved into data group action field during processing. The result of the requested action will be moved to the data group result field by PEM. The data group result copybook contains the tag names and values used to determine the result of the action.

If the program uses CDMF processing and/or Date Services, the corresponding copybooks for action and result codes will be included in the working storage of the program. The action tag name will be moved into the application control block prior to the call to PEM and the result will be tested against the results copybook.

Umbrella Programming

Programming Considerations

Hogan's Use of Binary Values

Many of the entries on the Process Dictionary and other CDMF records are keyed by binary values. In order to centralize the constant values used within a program for such items as activity numbers, they are defined in working storage.

In the release of Umbrella with CDMF, many of the keys are fullword in length (4 bytes). In releases prior to CDMF, these fields were halfword rather than fullword values. They were thus limited to the value 65,535 or less.

With the change to fullword values, the numbers reserved for customer use have been increased from 50,000 through 65,535 to two ranges:

- 50,000 through 100,000 AND
- 50,000,000 through 100,000,000.

COBOL has difficulty handling binary values. Hogan designers chose to use the binary format for its advantage of storing the largest possible number in a small storage area.

While some key fields such as TCB-CO-ID are defined to PEM as binary fields in data groups, these fields are defined as character in the copybooks included in the linkage section of a program. Programmers have to examine the data group definition on the Process Dictionary to identify the fields as binary.

To set the values for these keys, constants are defined centrally in Working Storage. These constants are defined as binary fields in which the values are set. They are redefined in character format for moves into the key fields.

Notes:

Halfword and Fullword Fields

Some key fields are halfword. These include TCB-CO-ID, TCB-USER-CC, PCD-ID, and TCB-RESULT.

With the CDMF release of Umbrella, two key fullword (four bytes) fields were added to the TCB. They are TCB-LONG-ACTIVITY and TCB-LONG-DGID. Prior to CDMF, activity numbers were set in TCB-ACTIVITY, and data groups were set in TCB-DATA-GROUP. These fields are halfword. They are, thus, limited to 65535 or less. The following illustrates a Hogan method for defining constant binary values in a program.

Redefinition Example

WORKING-STORAGE SECTION.

```
01 BINARY-VALUES
  05 HALFWORD-BINARY-N.
    10 FILLER          PIC S9(8) COMP VALUE +47190.
  05 HALFWORD-BINARY-X REDEFINES HALFWORD-BINARY-N.
    10 FILLER          PIC XX.
    10 PCD-ID-47190   PIC XX.
  05 FULLWORD-BINARY-N.
    10 FILLER          PIC S9(8) COMP VALUE +70000.
  05 FULLWORD-BINARY-X REDEFINES FULLWORD-BINARY-N.
    10 LK-ACTIVITY-70000  PIC XXXX.
```

© 2001 CSC. All rights reserved

Notes:

Umbrella Programming

Programming Considerations

Another method used for defining fullword constant binary values in Hogan programs is also used.

Redefinition Example

WORKING STORAGE SECTION

```
01 BINARY.  
 05 LK-ACTIVITY-70000.  
    10 FILLER      PIC S9(8) COMP VALUE +70000.
```

© 2001 CSC. All rights reserved

Note: S9(4) is the largest specification for a HALFWORD. The maximum value is +9999. S9(8) is the largest specification for a FULLWORD. The maximum value is +99999999.

While support for halfword programs is to be phased out over future releases, Umbrella System Version 3 Release 0 CST 1 allows existing halfword programs to execute fullword activities. This specifically supports Procedure Division copybooks written to use fullwords and be included in both existing halfword and fullword programs.

Notes:

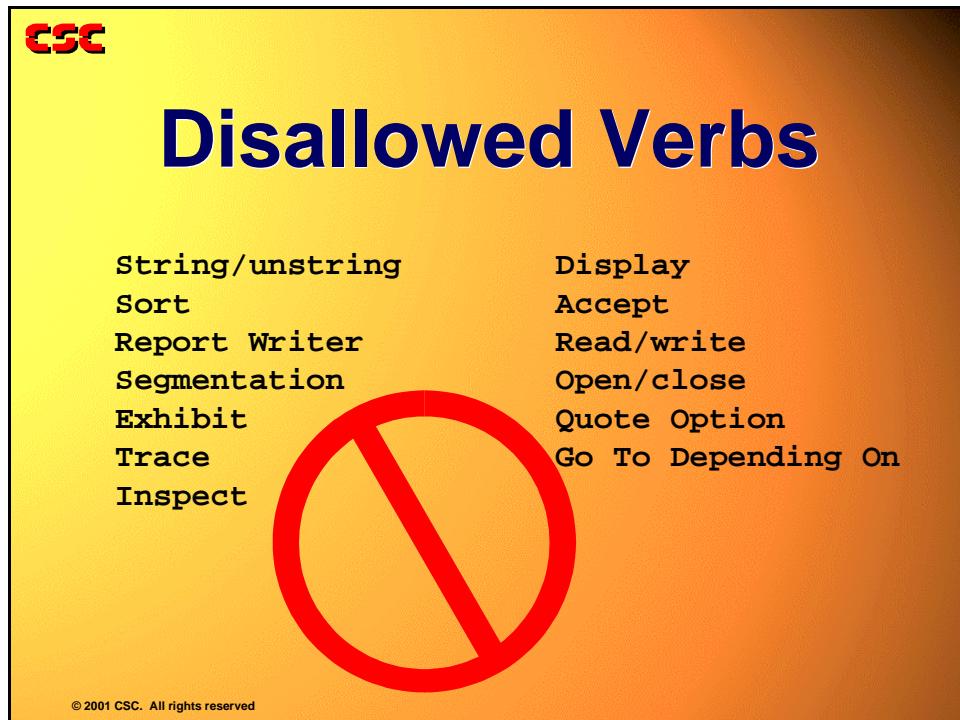

COBOL Coding Conventions When Running Under PEM

In general, the restrictions on COBOL programs are the same that apply to COBOL programs that run under CICS.

For the benefit of those users who do not have access to the IBM *CICS Application Programmer Reference Manual*, which itemizes these restrictions, a summary follows.

The following verbs are disallowed by IBM CICS:

Notes:

Disallowed Features

- Special features requiring an OS-GETMAN -
“current date”
- Options requiring use of Operating System Services
 - COUNT, ENDJOB, FLOW, DYNAM, STATE, STOP RUN*,
SYMDUMP, SYST, TEST, TCBSYSDATE
- Environment and Data Division entries associated
with Data Management
- File Section of Data Division

* Must be coded, but never executed.

© 2001 CSC. All rights reserved

Notes!!

- During the execution of a PEM transaction, data in the working storage section of the program should not be changed. Use a data group in linkage section for data that needs to be modified at execution time.
- In the case of CICS multi-tasking, different executions of a PEM transaction may be in progress concurrently within the same copy of a COBOL program.
- It is recommended that you use the Hogan delivered compile procedures.

Notes:

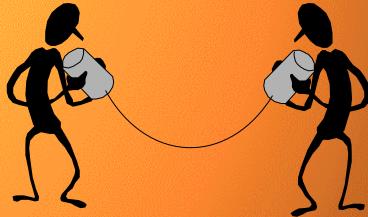

Communication Among Programs

CSC

Communication Among Programs

- Data Group
 - Application Control Block (ACB)
 - Application Data Group
 - Work Data Group
 - The TCB

© 2001 CSC. All rights reserved

PEM manages both program and data storage and executes application programs as subprograms. Information or data is communicated among programs in the task by interrogating the fields of data groups referenced in common. The most important concept to understand is that all programs within a task share a single copy of an allocated datagroup.

Note: All programs executed within a task SHARE one copy of an allocated datagroup.

When a program is executed within a task, the datagroups referenced by the Program Definition are checked by PEM against the task's Allocated Datagroup Table. If the datagroup has already been allocated to the task, the address of the datagroup is passed to the executed program in the form of a calling parameter list, constructed by PEM. If one or more of the datagroups have not been allocated to the task, PEM will allocate the datagroup(s), save them in the allocated datagroup storage area, and pass their address(es) to the executed program.

Note: PEM will allocate any UNALLOCATED data group(s) referenced by a program within a task.

Thus, before an application program is executed within a task, PEM allocates any unallocated data groups referenced on the Program Definition. Any other program within that same task requiring addressability to an allocated datagroup need only specify the datagroup on its Program Definition.

Umbrella Programming

COBOL Coding Conventions When Running Under PEM

Note: Only datagroups REFERENCED by a program should be specified on a its Program Definition.

In addition, many delivered subsystems use communication data groups that are sometimes identified as control blocks. For example, the application control block for Date Services is data group 2000.

The subsystems are typically invoked via standardized link activities. For example, activity 1900 is a delivered link activity to Date Services.

In this manner Hogan-delivered programs or customer-coded variations are able to utilize the services and facilities of the multitude of subsystems and subprograms that make up the Hogan System at any desired point in processing.

The fact that each program is a called subroutine encourages programs to deal with single functions and implies modularity. Ideally, a program that performs one functional task can be called at any point in processing by any program needing that particular task to be performed.

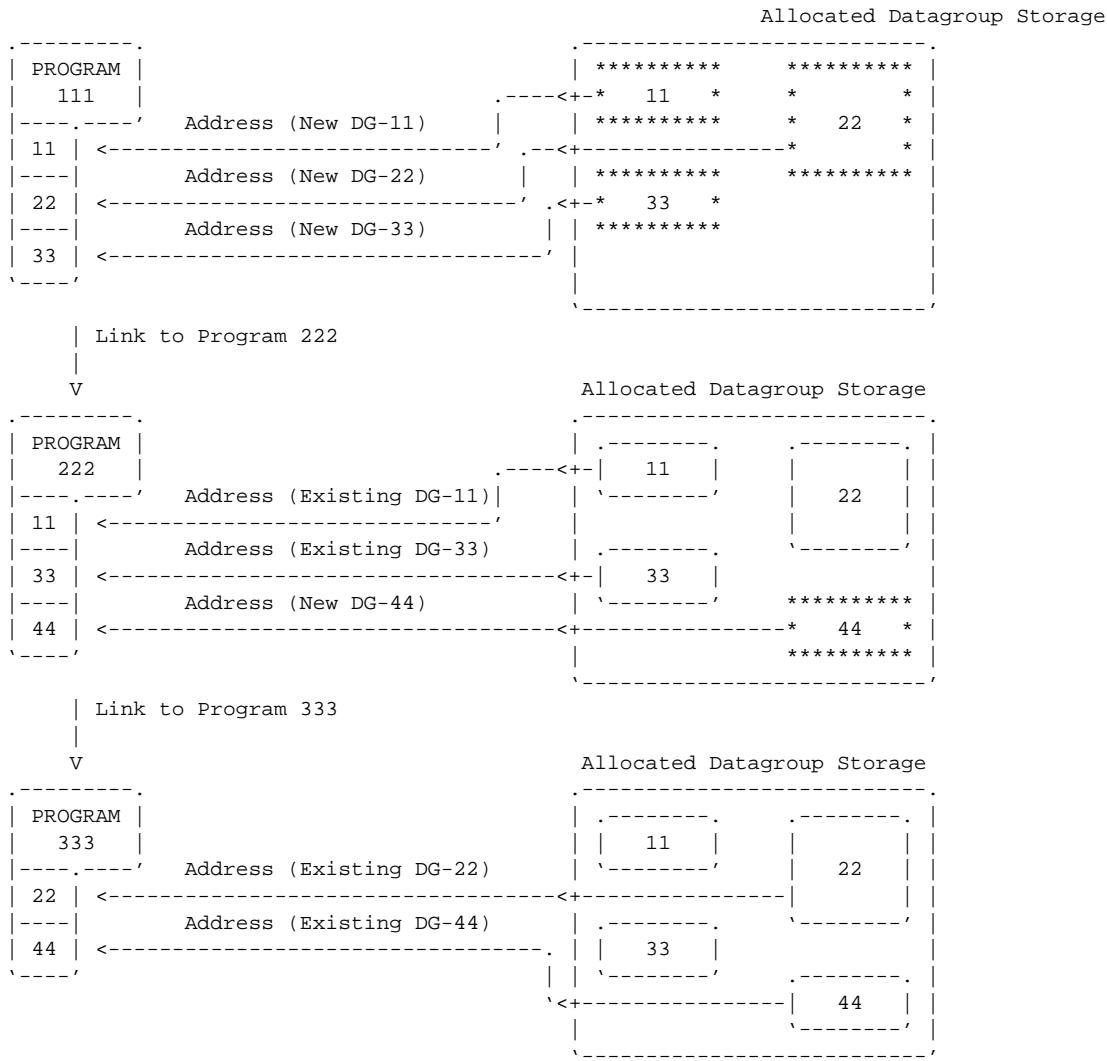

Notes:

Umbrella Programming

COBOL Coding Conventions When Running Under PEM

Program & Datagroup Relationships

This process may be summarized as follows:

- PEM locates Program Definition 111.
- PEM ALLOCATES datagroups 11,22,33.
- PEM invokes program AP111.
- Program AP111 begins executing.
- Program AP111 moves information into fields of datagroups 11,22,33.
- Program AP111 moves link activity 222 into TCB-LONG-ACTIVITY or TCB-ACTIVITY in the TCB.
- Program AP111 calls PEM using TRANSACTION-CONTROL-BLOCK. (01 level of the TCB).

Umbrella Programming

COBOL Coding Conventions When Running Under PEM

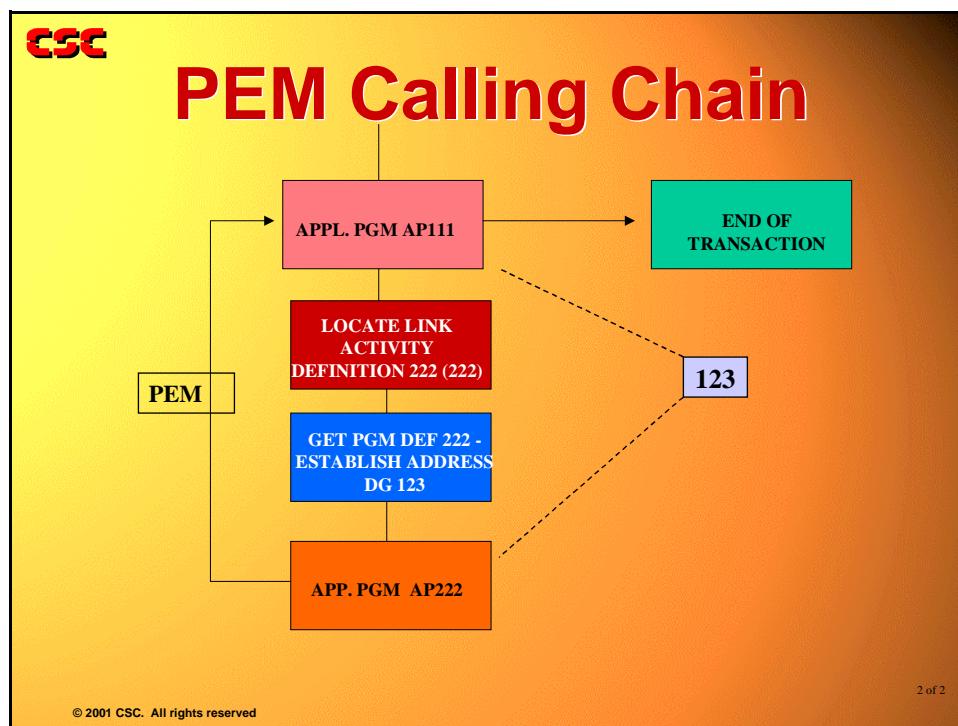

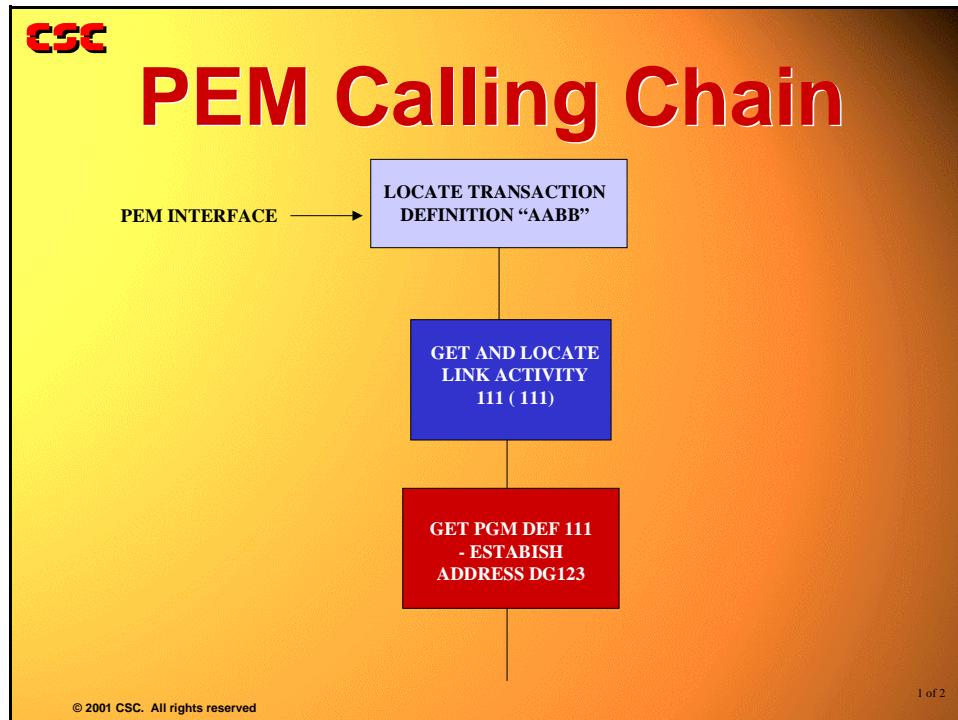

- PEM locates Program Definition 222.
- PEM ADDRESSES datagroups 11,33 and ALLOCATES datagroup 44.
- PEM invokes program AP222.
- Program AP222 begins executing.
- Program AP222 interrogates fields of datagroup 11.
- Program AP222 performs services based on codes or values in fields of datagroup 11.
- Program AP222 moves information into fields of datagroup 44.
- Program AP222 moves link activity 333 into TCB-LONG-ACTIVITY or TCB-ACTIVITY in the TCB.
- Program AP222 calls PEM using TRANSACTION-CONTROL-BLOCK. (01 level of the TCB).
- PEM locates Program Definition 333.
- PEM ADDRESSES datagroups 22,44.
- PEM invokes program AP333.
- Program AP333 begins executing.
- Program AP333 interrogates fields of datagroup 44.
- Program AP333 performs services based on codes or values in fields of datagroup 44.
- Program AP333 completes execution.
- PEM receives control and returns to program AP222.
- Program AP222 interrogates pertinent fields of datagroup 44.
- Program AP222 completes execution.
- PEM receives control and returns to program AP111.
- Program AP111 interrogates pertinent fields of datagroup 11.
- Program AP111 completes execution.
- PEM receives control and executes End-of-Transaction.

Umbrella Programming

COBOL Coding Conventions When Running Under PEM

PEM Calling Chain

Umbrella Programming

COBOL Coding Conventions When Running Under PEM

This process may be summarized as follows:

- Assume program AP111 is invoked by a link activity 111 from a Transaction Definition AABB.
- PEM locates Program Definition 111.
- PEM allocates datagroup 123.
- PEM invokes program AP111.
- Program AP111 begins executing.
- Program AP111 moves information into fields of datagroup 123.
- Program AP111 moves link activity 222 into TCB-LONG-ACTIVITY or TCB-ACTIVITY in the TCB.
- Program AP111 calls PEM using TRANSACTION-CONTROL-BLOCK. (01 level of the TCB).
- PEM locates Program Definition 222.
- PEM addresses datagroup 123.
- PEM invokes program AP222.
- Program AP222 begins executing.
- Program AP222 interrogates fields of datagroup 123.
- Program AP222 performs services based on codes or values in fields of datagroup 123.
- Program AP222 completes execution.
- PEM receives control and returns to program AP111.
- Program AP111 interrogates pertinent fields of datagroup 123.
- Program AP111 continues processing until EOP.

Checking Result Fields

Checking Results Fields

- ✓ After a data base activity
 - ✓ Check TCB-RESULT
 - ✓ Check Data Group RESULT fields
- ✓ After a link activity
 - ✓ NEVER check TCB-RESULT.
- ✓ After a link to a subsystem
 - ✓ Check the RESULT field of ACB

© 2001 CSC. All rights reserved

Checking Results Fields

- ✓ After communication with an application program
 - ✓ Check TCB-USER-CC (user field)
- ✓ After other types of activities
 - ✓ Check TCB-RESULT

© 2001 CSC. All rights reserved

Umbrella Programming

COBOL Coding Conventions When Running Under PEM

It is the responsibility of the application program issuing the activity to check the result of the action when control is returned to the program. The appropriate result field(s) should be checked to determine the status of the requested activity.

Summarized below are three key rules to follow in checking results:

1. After a data base activity, check TCB-RESULT. If the value is equal to TCB-OK, the DB activity was successful. A value not equal to TCB-OK indicates that some part of the DB activity failed, such as, end-of-data. You must then check the result field of the data groups referenced in the data base activity to determine the result of the requested action.

If the result field in the base data group or any dependent data group is not equal to DGR-OK, the data group's result field will contain the error code that corresponds to those in the delivered data group result code copybook, P49023D.

2. After a link activity, NEVER check TCB-RESULT. After a link to a subsystem, check the result field of the data group used to communicate information to and from that facility or program instead. This type of data group is known as the Application Control Block (data group 2000 is an Application Control Block for Date Services). The result code in the ACB will reflect whether the service was performed as expected.

Other fields may also need to be checked to determine if the correct information was passed back (such as, effective dates). Check these result fields in place of checking TCB-RESULT, which is not reset by PEM after a link activity is issued.

Communication between and among application programs may be achieved using TCB-USER-CC, which contains a user-supplied condition code.

3. After other types of activities, check TCB-RESULT. If it is equal to TCB-OK, PEM was able to complete the work of the activity. If not (and you did not abend), you should perform an error routine.

Notes:

Umbrella Programming

The Precompiler

The Precompiler

The purpose of the precompiler is to help reduce the number of PEM and COBOL program discrepancies that cause 0C4 protection exceptions, 0C7 data exceptions, and other abends. The precompiler compares the linkage section and using statement to the corresponding data group definition. If the length of the 01 level statement in the COBOL program is different from the length of the data group definition, it is noted in an error message.

Precompiler Messages

All messages issued by the precompiler are listed below in alphabetical sequence, based on the first word in the message.

NNNN BYTES RESERVED FOR DYNAMICALLY ALLOCATED DATA GROUP(S) XXX...XX

The indicated number (nnnnn) of bytes has been allocated for the dynamically allocated data group(s) indicated by the named 01-level (xxx...xx).

Dynamically allocating a data group larger than this could cause BLL cells to be updated incorrectly and produce unpredictable results.

CONDITION CODE 4 HAS BEEN SET DUE TO ERRORS FOUND

Due to a size difference error, source library system open failure, or 01-level sequence error, the condition code has been set to four (4).

CONTINUE CARD ERROR& - SKIPPING TO NEXT 01-LEVEL

An unexpected continue card was found. This is probably a sequence error or coding error in the source program. All cards between the card shown on the next line of the message and the next 01-level are not processed.

DATA GROUP dddd (bbbbbbbb) LENGTH (llll) IS NOT THE LENGTH (nnnn) OF xxx...xx

Where:

ddd is the data group ID

bbbbbbbb is the copybook from the data group definition

llll is the length of the indicated data group

nnnn is the length of the named 01-level

xxx...xx is the 01-level corresponding to the named DGID.

A size difference between the size of a data group definition and the size of the named 01-level has been found. (If the 01-level is the object of a redefines, the redefining 01-level may be longer and cause this condition.) If the error indicator (**** ERROR) precedes this message, the named 01-level is longer than the indicated data group

definition; it is this condition that is one cause of system 0C4 (protection exception) abends.

dddd DATA GROUP NOT FOUND ON DATA GROUP DEFINITION READ

The indicated data group definition (ddddd) was not found on the Process Dictionary.

EXPECTED 01-LEVEL NOT FOUND - SKIPPING TO NEXT 01-LEVEL

A new 01-level was expected but was not found. All cards between the card shown on the next line of the message and the next 01- level are not processed. The probable cause of this message is a missing 01-level in a copybook or a comment card without an asterisk (*) in column 7.

FIRST 01-LEVEL NAME IN USING STATEMENT MUST BE TRANSACTION-CONTROL-BLOCK

The first 01-level name in the USING statement is required by PEM to be the TCB.

ILLEGAL CHARACTER WITHIN PARENTHESES - SKIPPING TO NEXT CLAUSE

A nonnumeric character was found within the parentheses of a picture clause on the card shown on the next line of the message. Processing continues with the next valid clause in the sentence.

INVALID CLAUSE FOUND - SKIPPING TILL VALID CLAUSE FOUND

The data definition shown on the next line of the message contains an invalid clause. Processing continues with the next valid clause found.

LINKAGE SECTION MISSING - SKIPPING PROGRAM

The LINKAGE section was not found. Processing is discontinued.

NO CORRESPONDING DATA GROUP ID FOR xxx...xx

No corresponding data group definition identification number was found for the named 01-level (xxx...xx).

PICTURE CLAUSE INCOMPLETE - SKIPPING TO NEXT CLAUSE

End-of-sentence was found after the PICTURE clause but before the picture description.

PROCESSING HAS BEEN COMPLETED

All precompiler processing for this program has been completed.

PROGRAM DEFINITION NOT FOUND

The Process Dictionary did not contain a Program Definition for the ID supplied to the precompiler.

PROGRAM-ID CARD NOT FOUND

The PROGRAM-ID paragraph was not found. Processing is discontinued.

Umbrella Programming

The Precompiler

SOURCE LIBRARY SYSTEM OPEN ROUTINE FAILED - NO ADDITIONAL PROCESSING POSSIBLE.

The OPEN for the indicated source library system failed. Processing is discontinued.

SOURCE LIBRARY SYSTEM INCLUDE STATEMENT FOUND - SKIPPING TO NEXT CARD

An INCLUDE statement for the source library system was found and is displayed on the next line of the message. It is ignored.

UNEXPECTED END-OF-DATA FOUND - CANNOT CONTINUE

An end-of-data condition was found while processing the LINKAGE section. Processing is discontinued.

USAGE IS DISPLAY-ST HANDLED AS USAGE IS DISPLAY

A Sterling USAGE PICTURE description is handled as if it were USAGE DISPLAY.

01-LEVEL NOT FOUND IN LINKAGE SECTION FOR xxx...xx

The data name indicated (xxx...xx) was found in the USING statement, but was not found on an 01-level in the LINKAGE section. It is assumed that a COPY/INCLUDE was omitted in the source program, and processing continues.

01-LEVELS OUT OF SEQUENCE BEGINNING WITH xxx...xx

When dynamically-allocated data groups are used, the sequence of 01-levels in the linkage section must be the same as the sequence of 01-level data names in the USING statement. This message indicates that they are not in sequence beginning with the 01-level named (xxx...xx).

01-LEVEL xxx...xx SOURCE sssss...sss

Is the second line of some messages where:

xxx...xx Is the name of the 01-level for this card

sssss...sss Is the source card containing the condition causing the message

Notes:

Batch Program Execution

Executing a program that runs under PEM is not difficult. You must:

- Define a transaction with a source type of 4 with an activity that will link to your program.

In your JCL:

- Include an EXEC statement that invokes PEM
- Include DD statements for the data bases needed by your program (notice that DD statements are not needed for the CDMF data bases; they are included in the procedure specified in the EXEC statement.)
- Specify the key to the PEM transaction you want to execute in SYSIN.

Some sample JCL for batch program execution follows.

```
//          .....
//JS010    EXEC HOGNBPEM
//EMP      DD DSN=xxxV.EMP,DISP=SHR,
//          DCB=BUFN0=10
//SYSIN    DD *
1 99 9913
/*
//
```

Notes:

Problem Specifications—Batch Program

This lab will involve modifying and executing a program. A skeleton program is provided as the base of the program so that some setup code has been done for you.

In this problem, modifications are required to the program to read a data base.

Many of the necessary constants for processing have been predefined in the skeleton program. In addition, the coding to invoke the Scheduled Processing System for printing a detail report of the employee data base has been included.

Each group will expand its own version of a skeleton program. Each group will be provided JCL to execute the program.

Insert logic into the skeleton program to read sequentially all employee records that are contained in the employee information data base (DBID=EMP).

The data groups to be accessed from each employee record are 47100, 47110, 47120, 47130, and 47140. These data groups contain data elements that will be written into a report. The data elements and their COBOL data names are:

FROM DATA GROUP	COBOL NAME
COMPANY	47100
EMPLOYEE ID	47100
NAME (FIRST)	47110
NAME (LAST)	47110
DEPARTMENT	47120
JOB CLASS CODE	47120
POSITION CODE	47120
CURRENT EARNINGS	47130
YEAR-TO-DATE EARNINGS	47140

© 2001 CSC. All rights reserved

It is not necessary to provide logic to print the report. The code in paragraph PR000-PRINT-REPORT will invoke the services of SPS. SPS will locate the required data elements, move them to the print line, and print the report.

Umbrella Programming

Problem Specifications—Batch Program

The JCL required to execute the program in batch has been provided. The specific batch transaction, you created in a previous exercise, needs to be added to the JCL so that your batch transaction will be invoked by PEM.

Notes:

Umbrella Programming

Problem Specifications—Batch Program

Suggested Steps for Problem Solution

1. It will be necessary to add and/or modify entries to the Process Dictionary as follows:

- The Program Definition for the program Z9994xx, where xx is your group number, was coded in a prior exercise, and will need to be modified to meet the needs of this exercise.

Remember, the data groups on the program definition must be in the same order as they appear in the linkage section of the skeleton program Z9994xx, where xx is your group number. Be sure the program definition authorizes all activities that can be issued by the program. A list of predefined activities can be found among the binary fullword constants located in working storage.

A hard copy of the skeleton program is provided in this section.

- The Activity Definition 9994xx, where xx is your group number, to link to your program was created in a prior exercise.
 - The data base activity 9996xx, where xx is your group number, to read the EMP data base was created in a prior exercise. It should be reviewed and modified for this exercise.
 - Use the owner application and change control created in the Change Control Exercise.
2. Insert COBOL coding to your group's copy of the skeleton program to read the EMP Data Base.
 3. Each group will need to insert the following into the execution JCL after the SYSIN statement.

```
//SYSIN DD *  
1 99 99xx      where xx is your group number
```

Notes:

Summary

CSC

Summary

© 2001 CSC. All rights reserved

- PEM is in control with other programs acting as subroutines
- PEM addresses data through data groups
- Data groups in COBOL programs must match
 - Program definition on the Process Dictionary
 - LINKAGE SECTION of the program
 - 01 levels listed on the PROCEDURE DIVISION “USING” statement

CSC

Summary

- Transaction Control Block is key communication data group among PEM and all programs
- Never list TCB on program definition on the Process Dictionary
- Activities 1 - 100 are authorized for all programs
- Subsystems have other communication data groups, *control blocks*, to pass information

© 2001 CSC. All rights reserved

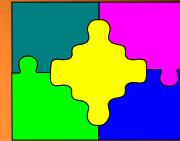

Summary

- Only static values are coded in working storage
- COBOL considers some fields character while PEM treats them as binary
- Application programs must check for results during processing flow

© 2001 CSC. All rights reserved

Summary

- The precompiler will compare linkage section and using statements of a COBOL program with data groups referenced on the Process Dictionary program definition. It will generate error messages that protect the programmer.
- Batch execution occurs by adding a transaction definition to Process Dictionary with source type 4 and placing the Company, Application ID, and Function of the transaction into SYSIN.

© 2001 CSC. All rights reserved

Umbrella Programming

Summary

- PEM is in control of programming flow when coding under any part of the Hogan System. All other programs run as subroutines of PEM.
- PEM establishes addressability to data through data groups.
- The order of data groups in COBOL programs must match in three key places:
 - Program definition on the Process Dictionary
 - LINKAGE SECTION of the program
 - 01 levels listed on the PROCEDURE DIVISION "USING" statement.
- The Transaction Control Block is the key communication data group among PEM and all application programs.
- Never list the TCB on a program definition on the Process Dictionary.
- Activities 1 through 100 are authorized for all programs to use.
- Subsystems have other important communication data groups, control blocks, to pass information among Hogan programs.
- Only static values are coded in working storage.
- Many key fields within the Hogan System are halfword and fullword binary values. Through redefining, COBOL considers the fields character while PEM treats them as binary.
- Application programs must check for results during processing flow. The type of activity issued determines the appropriate check.
- The precompiler will compare the linkage section and using statements of a COBOL program with the data groups referenced on the Process Dictionary program definition. It will generate error messages that will protect the programmer from many 0C4, 0C7, and other abends.
- Batch execution occurs by adding a transaction definition to the Process Dictionary with source type 4 and placing the Company, Application ID, and Function of the transaction into SYSIN.

Date Services System—DTS

13

Purpose

Date Services System - DTS

- ✿ Introduce a subsystem of the Umbrella
- ✿ Code use of Date Services System in a COBOL program
- ✿ Illustrate use of communication data group by subsystem

© 2001 CSC. All rights reserved.

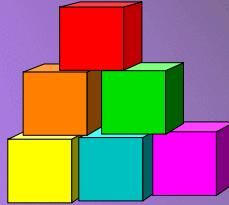

Notes:

Topics

CSC

Topics

- ★ Date formats
- ★ Date calculations
- ★ Date Services online screen
- ★ Data group 2000
- ★ Application programming code to invoke Date Services

© 2001 CSC. All rights reserved.

Objectives

CSC

Objectives

- List formats for storing dates under Hogan
- Give examples of the types of date calculations performed by the subsystem
- Use the online screen to do date manipulations
- Explain purpose of data group 2000 within Date Services
- Identify date services fields by comparing their COBOL names with location on date services map
- Invoke Date Services from an application program to do date manipulations.

© 2001 CSC. All rights reserved.

Date Services System (DTS)

The purpose of Date Services System is to provide a common routine for all Hogan Systems to request date manipulations.

Date Formats Supported

The requests will be performed in a uniform manner so that date calculations will be standard system wide. Five date formats are supported under the date services system.

The formats use the alpha codes:

Where:

C = CENTURY (0 = 20TH CENTURY)

Y = YEAR

M = MONTH

D = DAY

E = EDIT

© 2001 CSC. All rights reserved.

Notes:

Umbrella Programming

Date Services System (DTS)

Date Formats Supported

Format	Description
GREGORIAN (CYYMMDD)	This format is the system standard date format, usually packed decimal, century, year, month, and day.
JULIAN (0CYYDDD)	This date format consists of the century, year followed by the number of days since the first of the year. Usually packed decimal.
CALCULATION (00DDDDD)	This date format is the number of days since January 1, 1801. Usually packed decimal.
NUMERIC (CYYeMMeDD)	This is the edited display format of the Gregorian date. (e = edit character)
ALPHANUMERIC (MONTH DD, YEAR)	This is the written form of the Gregorian date for display.

© 2001 CSC. All rights reserved.

Notes:

Umbrella Programming

Date Services System (DTS)

The following example will illustrate the different formats for a single date.

FORMAT	FORM
GREG	0761220
JUL	0076355
CALC	0064272
NUM	076/12/20
ALPHA	DECEMBER 20, 1976

NOTE

- 0 is used for the century code for dates in the 20th century (1900).
- In the century, the value 1 indicates dates in the 21st century (2000).
- Use 9 for the century code for dates in the 19th century (1800).
- Holiday calculations or business day calculations cannot be executed on 19th century dates.

Notes:

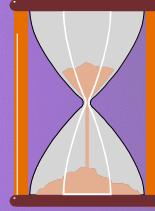

Date Calculations Supported

CSC

Date Calculations

- DTS converts and computes dates in any of the five supported formats
- DTS projects dates forwards and backwards in time
- For accurate projection, company holidays must be defined

© 2001 CSC. All rights reserved.

The Date Services routine can convert a Gregorian, Julian, or a Calculation Date into any of the other date formats. The routine can compute the number of calendar days, or the number of business days between two Gregorian, Julian, or Calculation dates. It can compute a new date from a Gregorian, Julian, or Calculation date. Either calendar or business days can be computed in the past or into the future.

It can convert a limited number of different display dates to a Gregorian date and determine if a Gregorian date is a calendar or business day; first of the month, quarter, or year; end of the month, quarter, or year; day of week; or if the year is a leap year.

Notes:

Holiday Calculations

CSC

Holiday Calculations

Setting up the Holiday Table: You can use-

- Specific date
- Day of week
- Occurrence from first of month
- Occurrence from last of month
- Options if holiday falls on non-business day
- Options if holiday falls in middle of week

© 2001 CSC. All rights reserved.

The Date Services routine will automatically calculate a holiday table for an entire year and store that table on PCD when a holiday of the year is first referenced. The user can add to the holiday table as necessary to augment the holiday calculation. Note, the system cannot handle dates in the years prior to 1900 for holiday calculations.

HOLIDAYS CAN BE DEFINED AS:

- SPECIFIC DATE
- DAY OF WEEK
- OCCURRENCE FROM FIRST OF MONTH
- OCCURRENCE FROM LAST OF MONTH
- OPTIONS IF HOLIDAY FALLS ON NON-BUSINESS DAY
- OPTIONS IF HOLIDAY FALLS IN MIDDLE OF WEEK

On the Date Services Holiday Table Screen, there is a command to rebuild the holiday table for the year specified in the effective date field.

Application Communication With Date Services

Date Service Actions

Select option 5 on the "Umbrella System Master Menu" to access the Date Services System online.

To use the Date Service Request Test, an action is required. Following is the list of the action numerical codes and their functions.

The fields in parentheses are used as input. The resultant output will be placed in the arrowed field.

Note: Actions asterisk (*), the SQL-DATE-IN can be used instead of the DATE-IN field.

Note: All file names begin with DCB - i.e. DCB - Date Out.

ACTION	FUNCTION	DATE-OUT
.	GREGORIAN TO 'DATE' (DCBDATE-IN)	→ DATE-OUT
1 *	GREGORIAN TO JULIAN	
2 *	GREGORIAN TO CALCULATION

Date Services Online Test Screen

U DTS from a cleared screen will display the Date Service Request Test Screen.

Press PF1 to display HELP information.

Notes:

Umbrella Programming

Application Communication With Date Services

Field Description/Values

ACTION

See list of actions on previous pages to enter the numeric code equivalent to function required.

RESULT

Error code will be returned in this field if necessary.

DATE IN

For actions 1-80 and 130-161 format is YYMMDD.

DATE OUT

For actions 50-70 (only) format is YYMMDD.

DIFF FACTOR

For actions 30-42 (only) format is **D** for day, **M** for month, **Y** for year.

DIFF AMT

For actions 30-42 (only).

BRANCH ID

This field is only used when Holiday Tables are generated for a branch, in which case the branch Holiday Table takes precedence over the company Holiday Table.

EDIT CHAR

For example, /, -, or blank.

RAW DATE

For actions 100-105 (only).

HOLIDAYS

System will return holidays for year entered in DATE IN.

DAY OF WEEK

System will return day of week for action 144. **1** for Sunday, **2** for Monday, and so on.

STATUS CHECKS

System will return.

SQL DATE IN

Date in the standard SQL format defined on the site control record.

The SQL formatted input date will only be used if the normal input date field (DCB-DATE-IN) is packed zero and the SQL date field is not blank.

SQL DATE OUT

This field will display the DATE OUT field contents in the standard SQL format defined on the site control record.

SQL TIME

Time in the standard SQL format defined on the site control record. This field is only used for the time conversion command. If Hogan time is being converted, the result will be displayed in this field.

STD TIME

Hogan formatted time assuming the sequence of years, months, and days as defined by the default edit pattern on the site control record. This field is only used for the time conversion command. If SQL time is being converted, the result will be displayed in this field.

OVRD DATE

This field overrides the SQL date format defined on the site control record.

TIME

This field overrides the SQL time format defined on the site control record.

Notes:

Umbrella Programming

Application Communication With Date Services

Date Service Research Exercise

1. How many days have you been living?
2. On which day of the week were you born?
3. Will 2004 be a leap year? Yes No
4. Which day of the week was new year's day, the year you were born?
5. What is 10 calendar days from today?
6. What is the alphanumeric date of the day you were born?

Date Control Block

Application programs communicate with Date Services through data group 2000. This data group is known as the Date Control Block and is defined by copybook T58001D (COBOL) and T58001E (ALC).

All communication with the Date Services System is achieved by loading the appropriate data into the Date Control Block and passing control to Date Services by issuing activity 1900.

On return from Date Services, the Date Control Block result field should be examined to determine if and how the date request was honored.

Umbrella Programming

Problem Specifications—DTS

The purpose of this problem is to develop the logic to convert the system IPL date from its packed format to an alphanumeric print format that is 10 business days greater than the IPL date.

The IPL date is contained in the TCB and may be referenced by use of the COBOL data-name TCB-SYS-DATE.

Note: The problem may require more than one Date Service action.

Leave the reformatted date in the appropriate output field in the date control block after conversion. SPS looks for the returned date in the DCB-RAW-DATE-AREA field.

Activity 1900 is used to link to Date Services. A COBOL definition for this activity has been included in your program.

The DTS communication data group 2000, known as the Date Control Block, is defined by COBOL copybook T58001D. T58001D has been included in the linkage section of your program.

The DTS action and result code static values, defined in COBOL copy books T58007D and T58008D respectively, have been included in working storage of your program.

Add the required code to your program.

Submit for compile/link.

To test your program, submit the execute job.

Notes:

Summary

Summary

- Date Services System performs a wide variety of date manipulations
- Five date formats are maintained. Gregorian (CYYMMDD) is system standard
- Date Services allows online manipulation by entering **U 5.1** or **U DTS** from cleared screen
- Data group 2000 is the DTS communication data group
- Link activity 1900 is delivered Process Dictionary activity to invoke Data Services System
- Each functional date manipulation requires a separate invocation of Date Services

Objectives

CSC

Objectives

To become familiar with:

- PCDs within Hogan's Systems
- Major components of CDMF data base
- Key fields for CDMF formats - new and converted PCD
- Effective-dated series
- Format definition and three key fields on definition
- FMT and NXTE performance and PF key assignment
- Item and format level defaulting
- CDMF format access coding
- PCD and CDMF format differences
- Converted PCD access coding

© 2002 CSC. All rights reserved.

1. To list two examples of the use of Process Control Data within HOGAN Systems
2. To describe the three major components of the CDMF data base
3. To list the key fields for CDMF formats—new and converted PCD
4. To give an example of an effective-dated series
5. To explain the purpose of a format definition and identify three key fields on the definition
6. To explain what the actions FMT and NXTE perform and give their corresponding PF key assignments
7. To distinguish between item and format level defaulting
8. To code the access of a CDMF format
9. To identify three differences between a converted PCD and CDMF format
10. To code the access of a converted PCD.

Process Control Data

Process Control Data

Process Control Data Introduction

Process Control Data Facts:

- **Contain System Variables: ie.**
 - Interest Rates
 - Location Codes
 - Fees
 - Data Validation values
 - Translation values
 - Processing options
 - &Much Much More
- **Stored on CDMF:**
 - Formats are Fullword tables
 - PCD's are Halfword tables
 - Both are stored the same way, but accessed differently depending on type

© 2002 CSC. All rights reserved.

Traditionally, system variables like interest rates, location codes and a host of others are stored in copybooks. They are included at compile time or read in as internal tables at execution time. Many application systems use indexed files to store the data. Both of these methods require special handling or additional programming when changes are made. If indexed files are used, special programs need to be written to add, change, and delete data on the file along with the utility processes to load, backup, and restore the data.

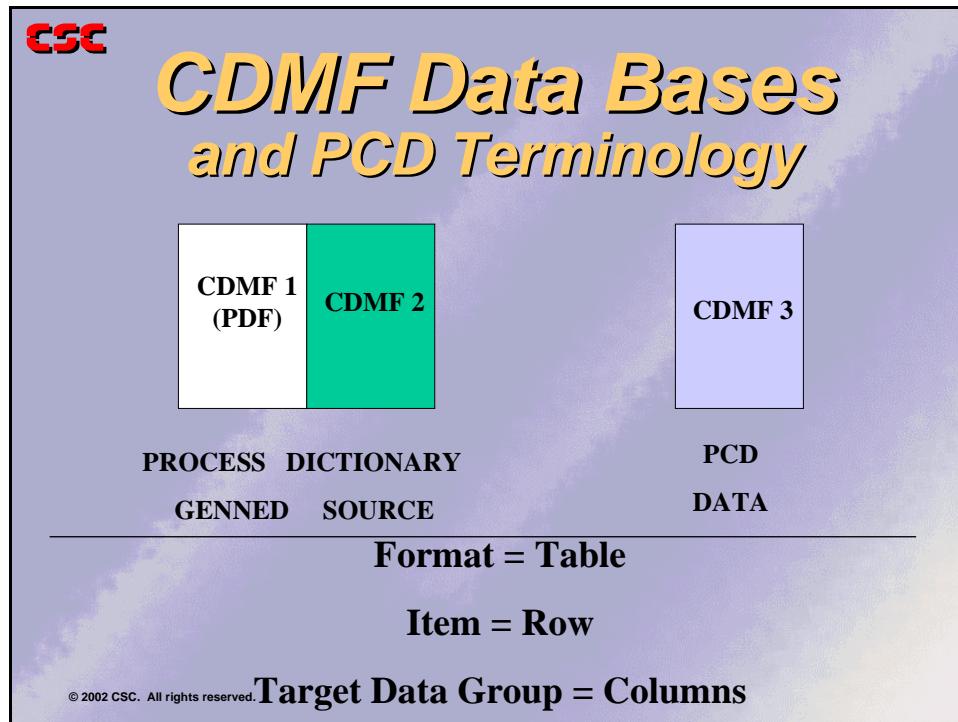

Keeping PCDs on the CDMF data base allows application processing criteria to be stored in a location external to the application programs. Changes to the data do not force a recompile of the application program(s) and PCDs can be shared by many applications. All of the processes needed to add, change, delete, and access PCDs are provided by the Umbrella System.

Process Control Data, or data that controls processing, is stored on the CDMF data base. Prior to the CDMF release of the Umbrella System, the data was stored on separate data bases used only for PCD processing. Part of the original CDMF release installation was to convert the old PCDs to the new CDMF technology. These converted PCDs are also referred to as simulated PCDs. New PCDs created today do not need to be converted. Both kinds of PCDs are stored on the CDMF data base and each has its own access method.

CDMF Concepts and Terminology

CDMF Components

Format

FORMAT = TABLE = FILE = PCDID = GROUP

In CDMF terminology groups of like records are called formats. The characteristics of each format are defined in a format definition.

Item

ITEM = ROW = ENTRY = RECORD = SET & ELEMENT

Each record in the format is called an item. All items in a format have the same data record layout. An items structure will be defined by a Data Group Definition, called Target Data Group.

FIELD = COLUMN = ELEMENTARY DATA

Each item is a collection of fields. Each field has its own unique size and structure, and shares the identical location across all the items.

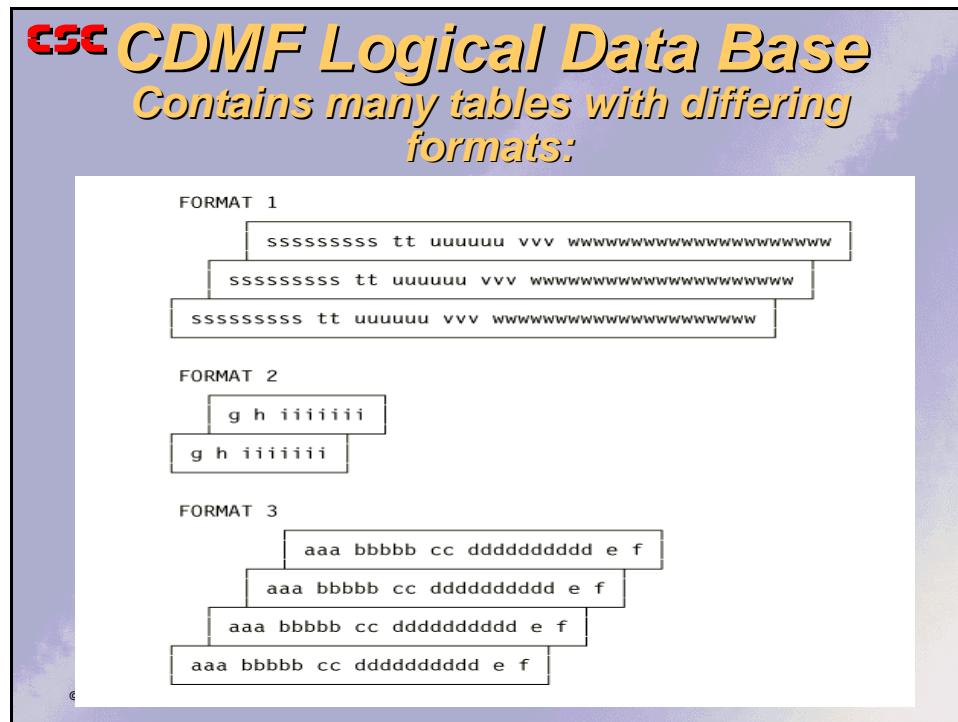

Umbrella Programming

CDMF Concepts and Terminology

Target Data Group

The items in each format are associated with a specific data group known as the target data group.

When an item is needed from a table or format, keys to the table and item are set up so that the retrieval can be made. The data is returned to the application program in the target data group. When items need to be updated, the data is assumed to be in the target data group.

Target data group defines the data fields contained in the item.

Each item has the same data structure, but contains different data values.

Many different formats are stored on the CDMF data base.

CDMF/PCD Key

The logical key of each CDMF item is composed of four parts:

FORMAT ID	A fullword binary number assigned to uniquely identify the format.
COMPANY ID	A halfword binary number used to relate a format to a particular company. The default company is identified by DFLT.
ITEM KEY	The item key is user-defined. The length of the key is defined on the format definition and may be up to 244 positions in length. The Change Control System has a restriction on the item key length of 64 bytes. Because Hogan Systems uses change control to deliver its releases, delivered PCDs have item keys of 64 bytes or less. The item key is located after the action and result fields in the target data group.
EFFECTIVE DATE	The date when the item becomes effective. The effective date is four byte packed field (CYYMMDD). On retrieval this date is normally allowed to default to the current processing date.

Notes:

Effective Dating Concepts

CSC

Effective Dating Concepts

- Effective Date part of key
- Effective series is an Item Key with more than 1 Effective Dated row
- Expiration date assigned by PEM.
No effective date ‘gaps’ are allowed.

© 2002 CSC. All rights reserved.

Each item on the CDMF data base has an effective date associated with it. The effective date is used to allow CDMF items that otherwise have identical keys to exist.

Items that have the same key except for different effective dates are said to be an effective series. The date range for one item is called an effective period.

The effective period of an item is bounded by an effective date and an expiration date. The effective date is entered at the time a CDMF item is created. The expiration date is assigned automatically by CDMF based on the dates of other items in the effective series. It is adjusted automatically as new items are created. Thus, effective ranges will not overlap or have a gap.

Whenever items with identical keys, except for different effective periods, are requested using the NXT action, the item with the highest effective period will be returned first. This is due to the order in which the items are stored on the data base. Effective dates are in 1's compliment form, causing the highest key to be stored first in the series.

If no effective date is entered, the default is the current processing date. For retrieval, normally the effective date is allowed to default. When creating an item the effective date should typically be input.

Defining a Format

Steps to Define a Format

A format is a collection of items, each of which has the same layout but contains unique data. When defining a new format to the CDMF data base, certain Process Dictionary components must be established. They are:

- CDMF Format Definition
- Data Group Definition—target data group
- Map Definition—for online maintenance.

The following discussion is a general overview of the screens and fields used in defining a format. The screens and Process Dictionary entries for format 47192 will be used as examples during the discussion.

Format Definition Screen

The purpose of the format definition is to identify the format processing components to PEM such as:

- Format ID
- CDMF Data Base or DB2 Table storing the items
- Target data group and key length
- Map ID for the display if the items are to be maintained online.

Format ID is a fullword field. This field is required and must be unique within Company ID.

The format mnemonic is an alphanumeric field that is required. Formats can be retrieved by mnemonic sequence by using the command BY MNEM and then using either NXT or INQ command.

Company number may be 1 through 65535, or the value of DFLT, which is internally represented as 65535. The use of company specific formats allows unique items for each company processed.

Format description field is for documentation.

Umbrella Programming

Defining a Format

The CDMF Database ID or Relational DBID indicates where the items in the format will reside. CDMF3 is the Data Base ID used to contain application related formats (PCDs). CDMF1 and CDMF2 are reserved for Process Dictionary entries.

SQL Activity is used to specify the Data Base Service Module (DBSM) to be used to access the Relational DBID.

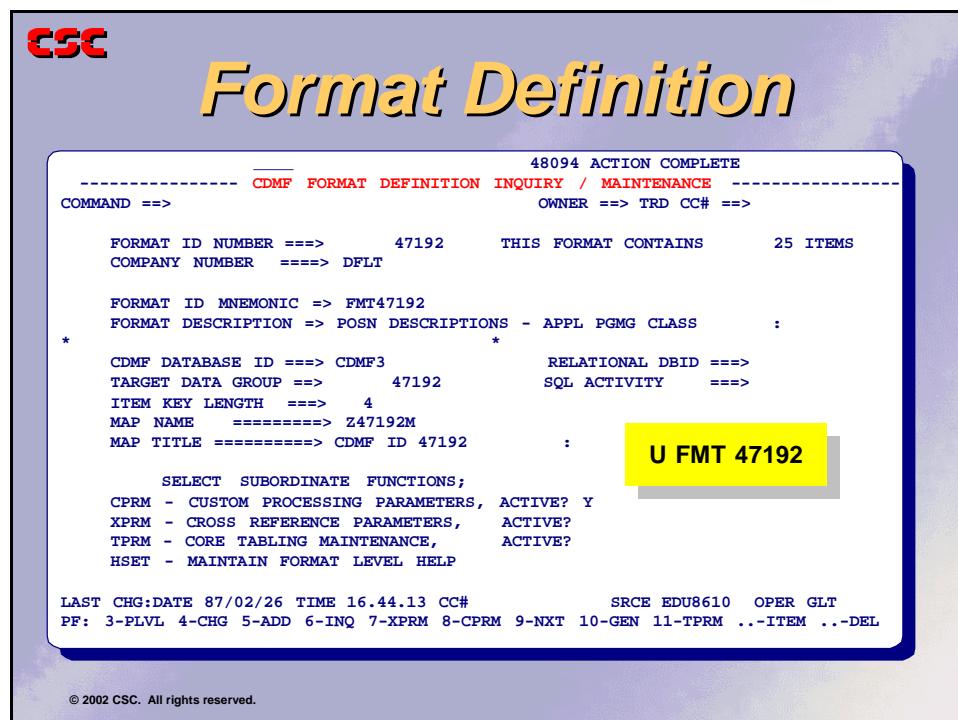

Target data group is a required field. The target data group provides addressability to the data in each format item and describes the layout of the data. This field will support fullword data group IDs.

Item key length is a required field. It should not include the four bytes of action and result within the data group.

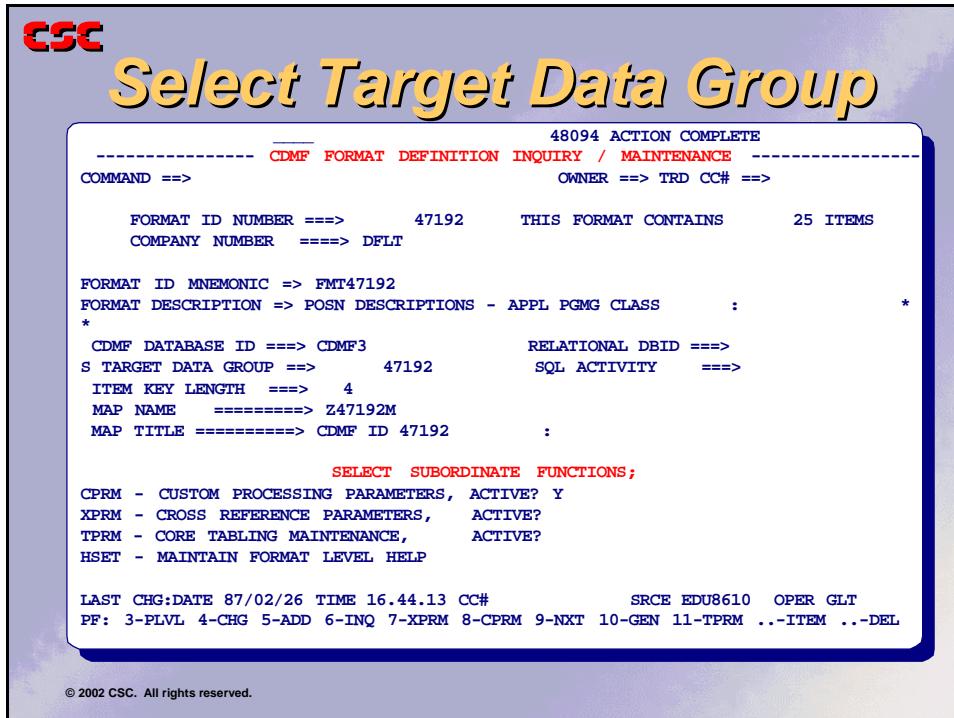

Map name should contain a Map ID if the format items are to be maintained online.

The map title will be displayed with the map screen during online maintenance.

The format definition base screen for format 47192 can be obtained with the command **U FMT 47192**.

Placing an S in the 1-byte field to the left of the TARGET DATA GROUP field and pressing the PF6 key will cause the Data Group Definition to be displayed for the Target Data Group ID.

Notes:

Umbrella Programming

Defining a Format

The data group definition screen is returned.

The screenshot shows a terminal window titled "Data Group Definition 47192". The title bar has the CSC logo. The main area displays a form for defining a data group. At the top, there is a header with fields for ACTION COMPLETE, PROCESS, DICTIONARY, DATA, GROUP, DEFINITION, and SETUP. Below this, the COMMAND is set to INQ and the OWNER is TRD CC#.

SPECIFY/VERIFY PARAMETERS BELOW:

Note: The transaction code is U140 on the "Map Definition Base Screen". The trancode for all item maintenance screens, regardless of which format is being processed, should be U140.

Notes:

Umbrella Programming

Defining a Format

Using the DSP command, the map is displayed below. The first four lines are the standard item maintenance FPS header, which is included map U48140E.

CSC

Map Definition Sample Display

```
XXXX XXXXXXXXXXXXXXXXXXXX ZZZZ XXXXXXXXXXXXXXXXXXXXXXXXX  
COMMAND ==> XXXXXX XXX OWNER ==> XXX X CC# ==> ZZZZZZZZZZ XXXXXX X X  
FORMAT ==> XXXXXXXXX COMP ==> XXXXX EFF ==> .00 HIGH USE? ==> XXX  
XXXXXXXXXX FOUND CO: NONE FND EFF: .00 EXPIRES: .00  
***** POSITION DESCRIPTIONS *****  
KEY = JOB CLASS + POSITION CODE  
JOB CLASS CODE ======> XX  
POSITION CODE ======> XX  
POSITION DESCRIPTION ===> XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX  
PF11 or DSP  
Command  
LAST MAINT: DT .00 TIME $9.99.99 CC ZZZZZZZZ OPER XXXXXXXX  
PF: XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX
```

© 2001 CSC. All rights reserved.

The last two lines are actually two include maps. The include map U48140F contains the last maintenance information fields. The include map U48100H, the last line on the map, is the PF key usage documentation line. All other lines are programmer designed and are used to display the item data from the target data group.

Notes:

Note: The positioning of the three include maps. Remember, an include map takes the row from the base map, and the column from the included map itself.

Each of the modifiable fields shown on the map definition are associated with one field in the target data group.

The screenshot shows a window titled "Map Definition Design". The window contains a text-based map definition with several lines of code. A yellow callout box highlights the text "PF7 or BROWSE Command".

Notes:

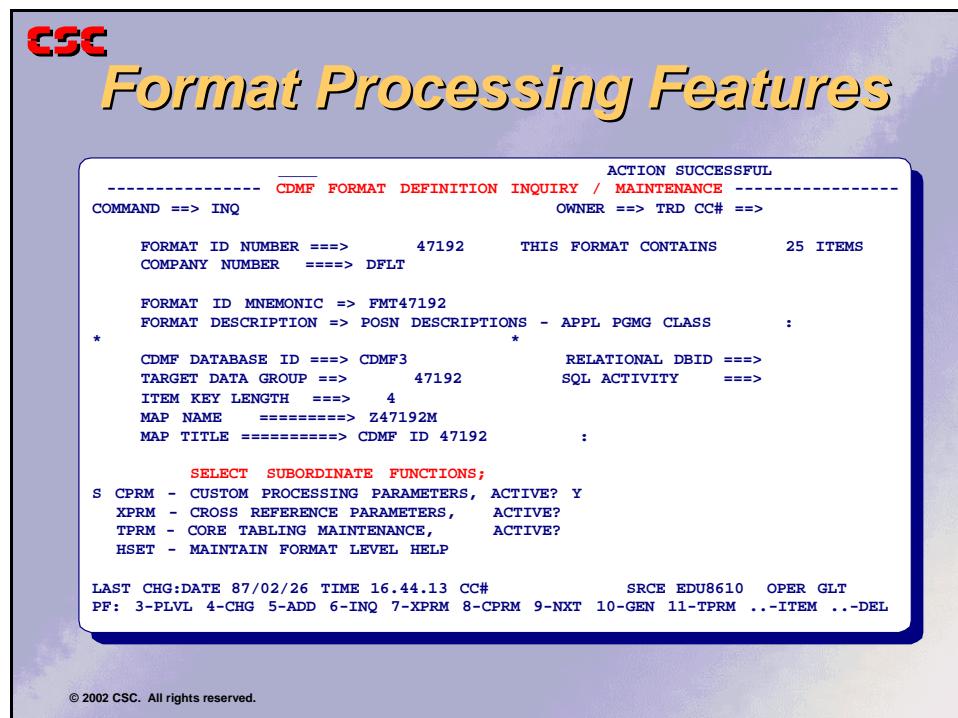

Umbrella Programming

Defining a Format

Under the headings SELECT SUBORDINATE FUNCTIONS are the four labels: CUSTOM PROCESSING PARAMETERS, CROSS REFERENCE PARAMETERS, CORE TABLING MAINTENANCE, and MAINTAIN FORMAT LEVEL HELP. A 'Y' next to ACTIVE? indicates there are parameters for this function.

Whenever a format is created, custom processing parameters are automatically created for the format. To view or modify the default parameters, 1) Press the PF8 key, or 2) Enter CPRM in the COMMAND field, or 3) place an S to the left of the function and press the PF6 key.

Notes:

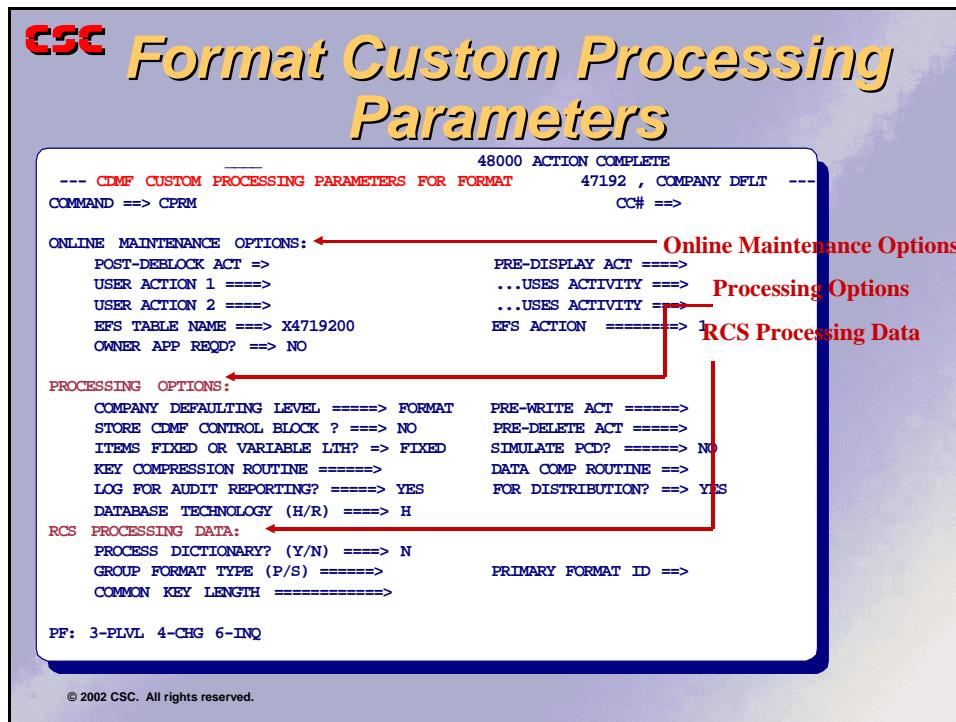

Format Custom Processing Parameters

The custom parameters are divided into functional groups. These groups are:

- Online Maintenance Options
- Processing Options
- RCS Processing Data.

Parameters under Online Maintenance are invoked whenever items are accessed using standard online item maintenance. The parameters under Processing Options are invoked whenever accessed by a program or standard item maintenance. The RCS Processing data is used by the Release Control System.

Notes:

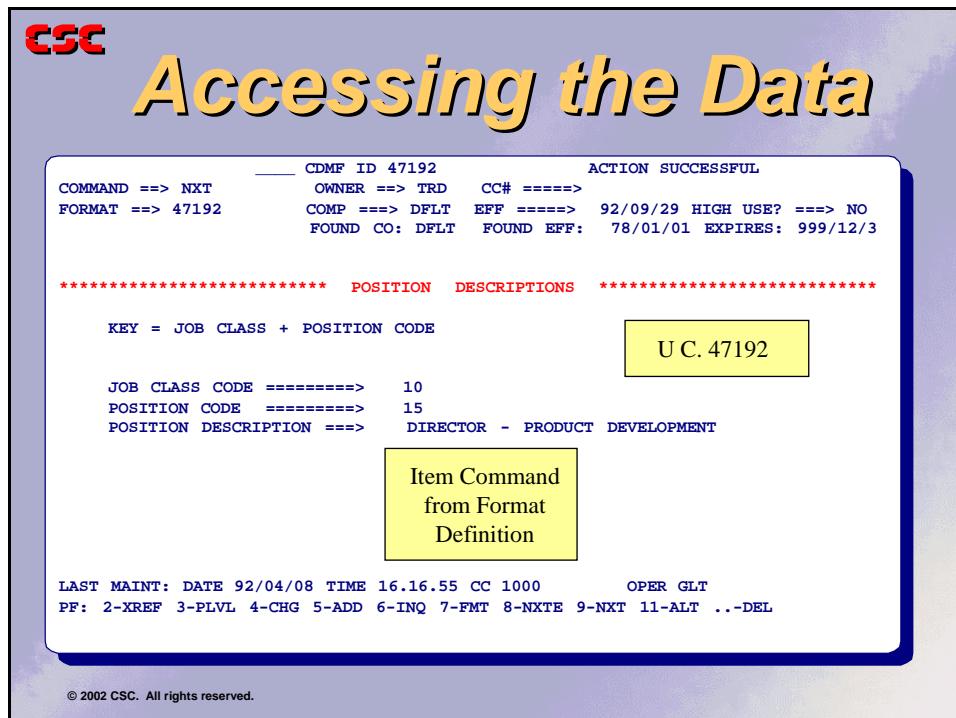

Umbrella Programming

Defining a Format

Accessing the Data

To access the data of format 47192, from a cleared screen, enter U PCD 47192. To access the data from the "CDMF Format Definition Inquiry / Maintenance" screen, enter ITEM in the COMMAND field and press ENTER.

- Items are maintained online
- An individual item is displayed.
- Items are keyed.

Notes:

Commonly Used Actions and Function Keys for CDMF Items

ACTION	PF KEY	DESCRIPTION
XREF	PF2	Display existing cross-references to this item.
CHG	PF4	Change data in an existing item.
ADD	PF5	Add a new item to the file.
INQ	PF6	Retrieve the item matching the item key input on the screen from the data base and present it.
FMT	PF7	Display the format definition for this item.
NXTE	PF8	Functions the same as NXT except that effective date is taken into account. Items will be retrieved only from the effective period first retrieved.
NXT	PF9	Retrieve the item with the next higher key than the one input on the screen and present it.
ALT	PF11	Display the next alternate format item screen.
ENDEFF	---	End the effective period of an existing item. (The item becomes invalid as of the date specified in the effective date field.)
DEL	---	Delete an existing item.

Notes:

Defaulting Concepts

CDMF supports two levels of defaulting in the selection of the items. The type of defaulting to be used is indicated on the custom parameters screen of the format definition. The two types of defaulting are:

- Format level defaulting (default)
- Item level defaulting.

Format Level Defaulting

HOGAN provides a company called DFLT (default) to meet the more common processing requirements.

Should the processing requirements of a company be different from those supplied for company DFLT, a company format may be created comprised of CDMF items specific to that company.

Format level defaulting should be used when there are large numbers of items that are different between companies.

Search criteria for a given format:

csc *Defaulting Concepts*

■ Format Level Defaulting

Action is requested on an item for a specific company
If the format table exists for the specified company
Then ONLY that table is searched:
 If the item row is in the company format table then
 the item is found and returned,
 Else the item is not found,
Else the DFLT format table is searched:
 If the item is defined in the DFLT format table then
 the item is found and returned,
 Else the item is not found.

© 2002 CSC. All rights reserved.

Format Defaulting Examples

Let's examine some examples of search and retrieval with "format" defaulting as illustrated below.

FORMAT 2468		FORMAT 2468		FORMAT 2468		FORMAT 2468	
COMPANY	DFLT	COMPANY	12	COMPANY	56	COMPANY	917
FORMAT		FORMAT		FORMAT		FORMAT	
KEY	DATA	KEY	DATA	KEY	DATA	KEY	DATA
AA	11	AA	21	BB	57	DD	93
BB	22	BB	31	CC	57	NN	92
CC	33	DD	41	HH	34	PP	90
DD	44	FF	51	JJ	39		
				KK	55		

FORMAT	SEARCH VALUES		RESULT OF SEARCH	
	COMPANY	ITEM KEY	COMPANY	DATA
2468	12	AA	12	21
2468	86	CC	DFLT	33
2468	56	AA	NOT FOUND CONDITION	
2468	DFLT	CC	DFLT	33
2468	357	FF	NOT FOUND CONDITION	
2468	917	PP	917	90

Notes:

Umbrella Programming

Defaulting Concepts

Item Level Defaulting

Item level defaulting is best used when there are few differences in the contents of items between companies. Only items that differ from those on the DFLT company need be created.

Using item level defaulting causes CDMF to view the format for a specified company and that of the DFLT company as if they were concatenated.

Search criteria for a given format:

The slide has a red 'CSC' logo in the top left corner. The title 'Defaulting Concepts' is in large yellow font. A section titled '■ Item Level Defaulting' is shown. Below it is a flowchart of the search logic:

```
graph TD; A[Action is requested on an item for a specific company.] --> B[If the format table exists for the specified company]; B --> C[then that table is searched]; C --> D[If the item key is in the company format table then]; D --> E[the item is found and returned]; D --> F[Else the DFLT format table is searched]; F --> G[If the item key is in the DFLT format table then]; G --> H[the item is found and returned]; G --> I[Else the item is not found]; I --> J[Else the DFLT format table is searched]; J --> K[If the item key is in the DFLT format table,]; K --> L[the item is found and returned]; K --> M[Else the item is not found.]
```

Notes:

Application Access to CDMF Formats

Accessing CDMF—New Technology

The CDMF Application Control Block (ACB) is used to communicate to the CDMF processor. These fields are located at the end of the TCB. To communicate with CDMF:

1. Fill out the following fields in the ACB.

CDMF-ACTION

Action for the request. Action codes are defined in COBOL copybook U48004D and in U48004E for ALC.

CDMF-FORMAT

Format ID (fullword binary) of the formatted being requested.

CDMF-COID

Company ID (halfword binary) of the formatted being requested.

CDMF-EFF-DATE

Optional (if zero defaults to TCB-EFFECTIVE-DATE)

2. Fill out the item key information in the target data group for the format being retrieved. The item key starts after target data group action and result fields.
3. Issue activity 48000, the link activity to CDMF processing.

Returned by the CDMF processor:

Information returned in the following ACB fields:

CDMF-RESULT

Result of the requested action. Result codes are defined in COBOL copybook U48024D and in U48024E for ALC.

CDMF-EXP-DATE

Last date for which the item last retrieved is valid.

CDMF-COID-FOUND

Company ID for which the item last retrieved is found.

CDMF-EFF-DATE-FOUND

Actual effective date of the item last retrieved.

Information returned in the target data group:

The entire data area from the requested item.

CDMF Application Control Block

The CDMF ACB is part of the UTCB.

Notes:

Problem Specifications—CDMF Access

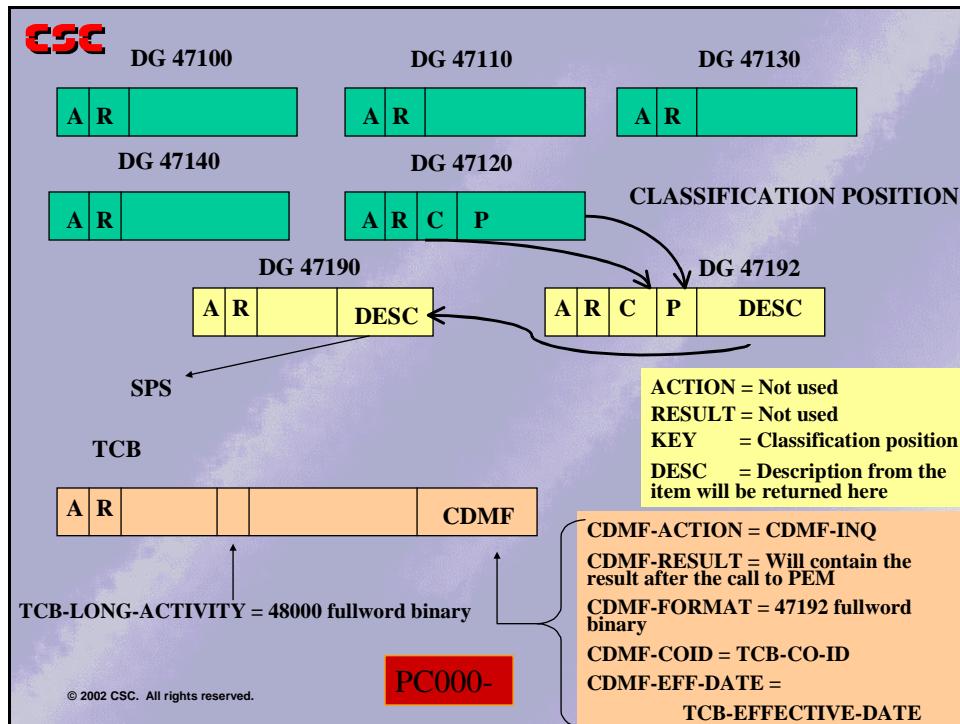

1. The purpose of this phase is to read a CDMF format—47192 to obtain the corresponding position description for the employee's job classification and position. Data group 47120 contains the job classification and position codes needed to build the item key. Data group 47120 is part of the EMP data base. Make sure your data base activity is accessing DG 47120.
2. The item key of the CDMF format 47192 consists of a 2-byte JOB CLASSIFICATION CODE and a 2-byte POSITION CODE.

CDMF action and result code values are defined by the COBOL copybooks U48004D and U48024D respectively. These have been included in your skeleton program.

3. Use activity 48000 to link to CDMF. The link activity is defined in the Process Dictionary. Your copy of the class program contains the binary defined field for the link to CDMF PCD processing.
4. Take the following actions based on the CDMF result code returned after having invoked CDMF.
 - If the CDMF result is not equal to low values, take the following actions based on the CDMF result code:
 - If the result indicates NO FORMAT FOUND, move the message NO FORMAT FOUND to the position description field in data group 47190.
 - If the result indicates NO ITEM FOUND, move the message NO ITEM FOUND to the position description field in data group 47190.
 - If the result indicates other errors, the program should execute a dump and end.
 - The SPS program prints the position description from data group 47190. Your routine will need to move the position description from DG 47192 to DG 47190.
5. Use the owner application and change control created in the Change Control Exercise.

How Old and New Formats Differ

Items Converted From the PCD System

The following are examples of items converted from the Process Control Data System. Under old technology, the user key length was fixed at 11 bytes. If more than 11 bytes were needed for the item key or items needed to be grouped within user keys, an element key could be set up. The element key is also referred to as the recursive key.

The user key appears in the screen header display. If the PCD contains an element key, it will be identified in the user defined portion of the screen display by key data or similar notation.

Note this example of a converted PCD with its user key.

Notes:

Application Access to PCD Formats

Accessing Simulated PCD—Converted

Due to the large numbers of programs that accessed PCD under the old technology, a means to access the CDMF interface, which simulates the old PCD system, has been provided. With this simulation, existing application programs do not need changes.

In order to simulate PCD:

1. Fill in the fields of data group 1452, the PCD control block as follows:

PCD-ACTION

Action for the request. Action codes are defined in COBOL copybook I57104D and in I57104E for ALC.

PCD-COID

Company ID (halfword binary) of the formatted being requested.

PCD-ID

Format ID (halfword binary) of the formatted being requested.

PCD-USER-KEY

Item key

PCD-EFFECT-DATE

Optional (if zero defaults to TCB-EFFECTIVE-DATE)

2. Fill in the element key in the target data group if the PCD is recursively keyed. The element key is located after the action and result fields in the target data group.
3. Issue activity 1013 (read only) or activity 1014 (read/update) to link to the PCD interface process.

Returned by the PCD processor:

Information returned in data group 1452

PCD-RESULT

Result of the requested action. Result codes are defined in COBOL copybook I57105D and in I57105E for ALC.

PCD FIELDS

Filled in before issuing the activity.

Information returned in the target data group:

The entire data area from the requested item

Problem Specifications—PCD Access

1. The purpose of this phase is to read PCD format 47190 to obtain the corresponding position description for the employee's job classification and position. Data group 47120 contains the job classification and position codes needed to build the item key. Data group 47120 is part of the EMP data base. Make sure your data base read activity is reading DG 47120.
2. CDMF format 47190 is a converted PCD. You will need to use data group 1452, the old PCD communication data group, to communicate with CDMF.

Prior to the conversion JOB CLASSIFICATION was the user key and POSITION CODE was the element key.

PCD action and result code values are defined by the COBOL copybooks I57104D and I57105D respectively. These have been included in your skeleton program.

3. Use activity 1013 to link to CDMF. The link activity is defined in the Process Dictionary. Your copy of the class program contains the binary defined field for the link to PCD processing.
4. Take the following actions based on the PCD result code returned after having invoked CDMF.
 - If PCD-RESULT is not equal to low values, take the following actions based on the PCD result code:
 - If PCD-RESULT indicates NO GROUP FOUND move the message NO GROUP FOUND to the position description field.*
 - If PCD-RESULT indicates NO ELEMENT FOUND move the message NO ELEMENT FOUND to the position description field.
 - If PCD-RESULT indicates other errors, the program should execute a dump and end.
 - The SPS program prints the description from the position description field in data group 47190.
 - Use the owner application and change control created in the Change Control Exercise.

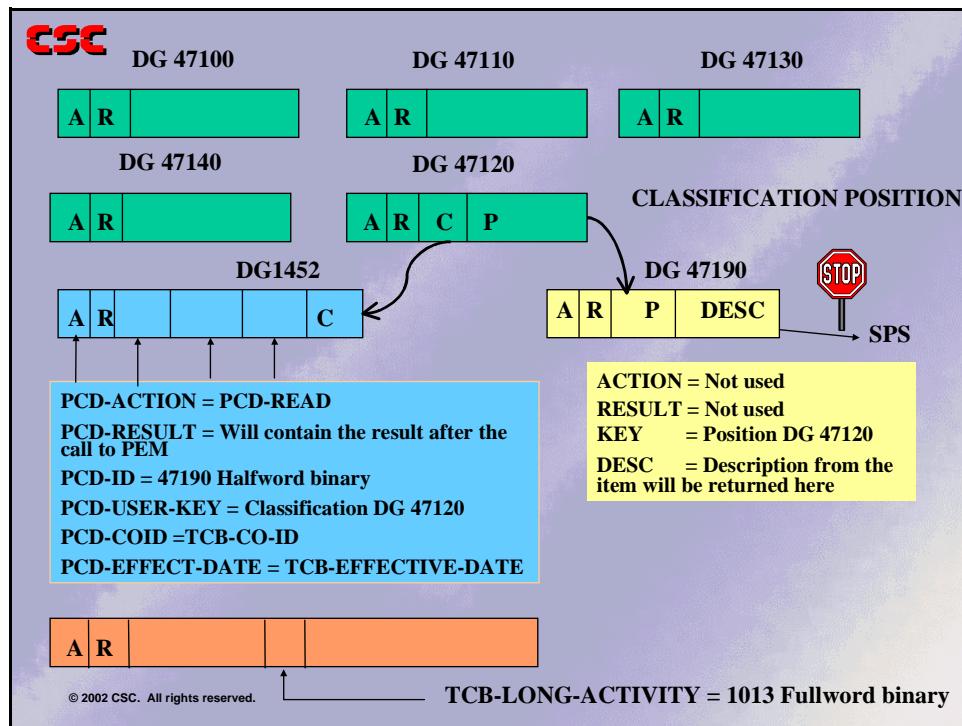

*NO GROUP FOUND is the error message when the PCD (Format) cannot be identified.

Umbrella Programming

Problem Specifications—PCD Access

PCD Diagram

Notes:

Problem Specifications—Format Definition (Optional Exercise)

This exercise will reinforce the tasks needed to create a Format Definition. The format you will create and the data you add to the format will be accessed online and by your program.

In this exercise, you will not be required to add a data group or map definitions. The TARGET DATA GROUP and MAP NAME for format 47192 will be used.

To define the format definition using follow information.

1. The Format ID is 47192.
2. The Company ID is 99xx, where xx is your group number.
3. The Mnemonic should include your group number, as should the description.
4. Use CDMF3 as the data base.
5. The TARGET DATA GROUP ID will be 47192.
6. The length of the key is four bytes.
7. The Map Name is Z47192M for this format.
8. The Map Title should include your group number.
9. Use the owner application and change control created in the Change Control Exercise.
10. At this point you should be able to add items to your format using the Online Item Maintenance processor. From the Format Definition screen, type ITEM into the Command field, and press enter. Alternately, you may access your new CDMF format by entering, from a cleared screen, U C.47192. This will probably display the DFLT company version of 47192. In order to address your CDMF format, change the value of the COMP field to 99xx, where xx is your group number, and press PF6 (INQ). Either option should display the message "48005 END OF FORMAT".
11. Add items to your format using the item keys listed below. You may choose to be creative with the descriptions. Be sure to use Company 99xx and 780101 for your effective date.

JOB CLASS	JOB POSITION	JOB CLASS	JOB POSITION
10	15	40	20
10	60	40	99
20	30	50	11
20	47	50	23
30	30		
30	35		

Umbrella Programming

Problem Specifications—Format Definition (Optional Exercise)

12. Modify your COBOL skeleton program to PERFORM routine PC000(CDMF access), and to bypass routine PC100(PCD access). This can be accomplished by commenting out the PCD PERFORM statement in the main-line section.
13. Modify your execution JCL to test using Company 99xx. The application and function values should remain the same.
14. Submit the execution JCL to test your program against your CDMF format of position descriptions. Remember, the report will print with many more ITEM NOT FOUND items, because you only created a small set of the descriptions used by the Employee System.
15. After checking your report for the new position descriptions from your CDMF format, change your Format Definition allowing the concatenation processing of your CDMF format and the DFLT CDMF format for 47192.
16. Submit the execution JCL to test your program against your format and DFLT format of position descriptions. Now, the report will print with fewer ITEM NOT FOUND because two formats are being searched and combined.

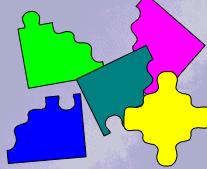

Notes:

Summary

CSC

Summary

- ✓ Information usually housed on tables are stored as CDMF Formats, also known as PCD's
- ✓ Major components of CDMF Formats:
 - ✓ Format (Table)
 - ✓ Item (Row)
 - ✓ Target data group (Columns)
- ✓ CDMF Formats = collection of tables of varying structure, which replaces the COBOL Search verb and working storage tables

© 2002 CSC. All rights reserved.

CSC

Summary

- ✓ CDMF key fields
 - ✓ Format ID
 - ✓ Company ID
 - ✓ Item key
 - ✓ Effective date
- ✓ CDMF format items can be effective dated
- ✓ Table must be defined online as a Format Definition
- ✓ CDMF actions and PF keys:
 - ✓ = Standard Process Dictionary actions
 - ✓ + ITEM, FMT and NXTE

Umbrella Programming

Summary

Summary

- ✓ Methods for concatenating tables to search for item:
 - ✓ Format level- Search ONLY first table found
 - ✓ Item level- Search first table found, then DFLT table
- ✓ New CDMF formats accessed through CDMF driver activity 48000
- ✓ Bridge for accessing old technology using activities 1013 & 1014
- ✓ Simulated PCD's have standard size user key (11 bytes) and may have element key (for keys longer than 11 bytes).
- ✓ All HOGAN applications use PCD's
- ✓ Umbrella subsystems use PCD's

© 2002 CSC. All rights reserved.

- Information such as interest rates and coded descriptions that would be generally be housed on tables are stored online under the Umbrella System as Process Control Data. Two key features of such data are that they change frequently and need to be accessed by multiple application programs.
- The three major components of CDMF are a format (file), item (record), and target data group (record layout).
- CDMF is a collection of multiple files of varying formats.
- The CDMF key fields are—format ID, company ID, item key, and effective date.
- Items on CDMF formats can be effective dated to form effective series.
- A file must be defined online as a format definition. Various Process Dictionary definitions are required as support items, such as, data group and map definitions.
- Commonly used CDMF actions consist of the Standard Process Dictionary actions plus FMT and NXTE.
- There are two methods for searching a file for an item—format level and

Umbrella Programming

Summary

item level.

- Accessing new CDMF formats is through the CDMF Application Control Block (part of the TCB) and link activity 48000.
- A bridge was written so that tables that were formerly PCDs continue to be processed as they were under old technology. They are accessed through PCD control block 1452 and activity 1013 or 1014.
- Simulated PCDs have a standard size user key and may have an element key to form the CDMF item key.
- All HOGAN applications use PCDs.
- Umbrella subsystems such as DTS, SPS, and FPS use PCDs to store process-directing data for date calculations, report generation, and screen flow, respectively.

Notes:

Topics

Topics

- User-defined processing exceptions
- CDMF format 1301
- Activities 1350 and 1398
- TCB-user-cc
- Target data group 48551

© 2001 CSC. All rights reserved.

Notes:

Objectives

CSC

Objectives

To become familiar with:

- Use of CCP for user-defined exceptions
- Item key for CDMF format 1301
- Purpose of data fields on format 1301
- Distinction between activities 1350 and 1398
- Processing flow of CCP
- Use of TCB-USER-CC within CCP

© 2001 CSC. All rights reserved.

1. To explain the use of CCP for handling user-defined exceptions
2. To explain the item key for CDMF format 1301
3. To describe the purpose of the data fields on format 1301
4. To distinguish between the use of activities 1350 and 1398
5. To illustrate processing flow of CCP
6. To define the use of TCB-USER-CC within CCP to explain how control data group 48551 is used.

Notes:

Condition Code Processing Capabilities

CSC

Condition Code Processing

- Error Conditions
- Non-error condition
 - Offers:
 - Standard approach to MSG Handling
 - Online maintained via CDMF
 - MSGs stored external to application program

© 2001 CSC. All rights reserved.

User-Defined Exceptions

Condition Code Processing (CCP) gives a standard approach for identifying and handling user-defined exceptions. Through parameters maintained online, one can externally control application logic flow for exceptional situations. For example, suppose that a program encounters invalid data. Rather than hard-code an error-handling routine into the program, a condition code may be set and control passed to the Condition Code Processing system.

There are two advantages of this approach. The processing of errors can be changed without recoding, recompiling, and relinking the application program. In addition, the condition code can be passed as a parameter among application programs in a calling chain.

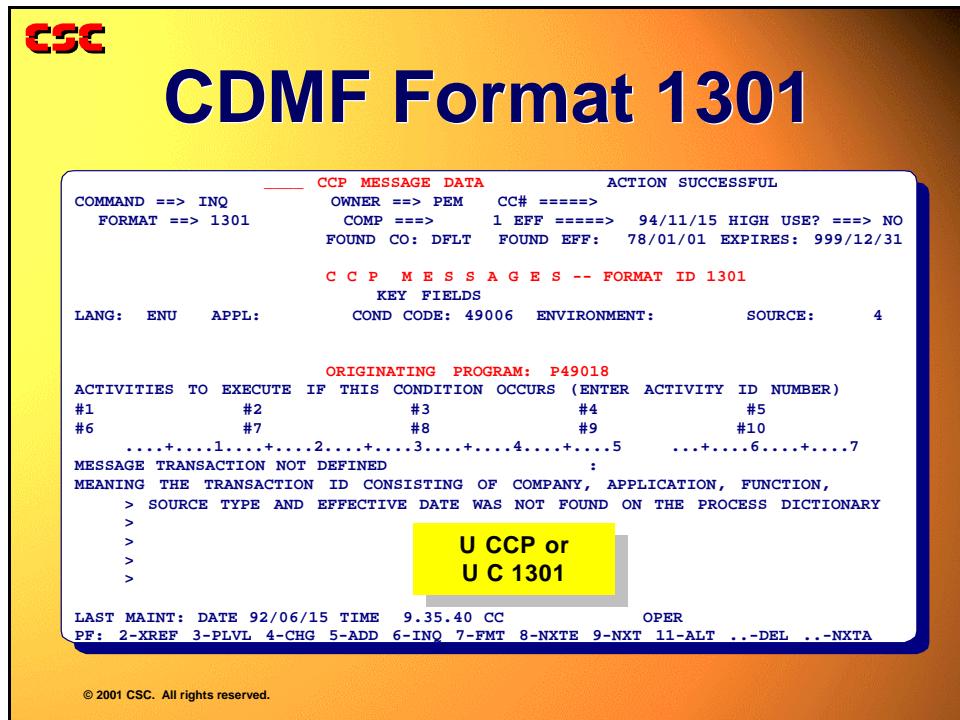

Notes:

CDMF Format 1301

Condition codes are maintained on the CDMF format 1301. This format was a PCD under the old technology. It has been converted so that it is now a native CDMF format.

There are two important pieces of data stored on CDMF 1301. A message field is provided. This message can be displayed online or printed on a report. In addition, activities for processing the errors (printing a warning message, issuing a dump, abending, and so on) are listed on the entry.

Notes:

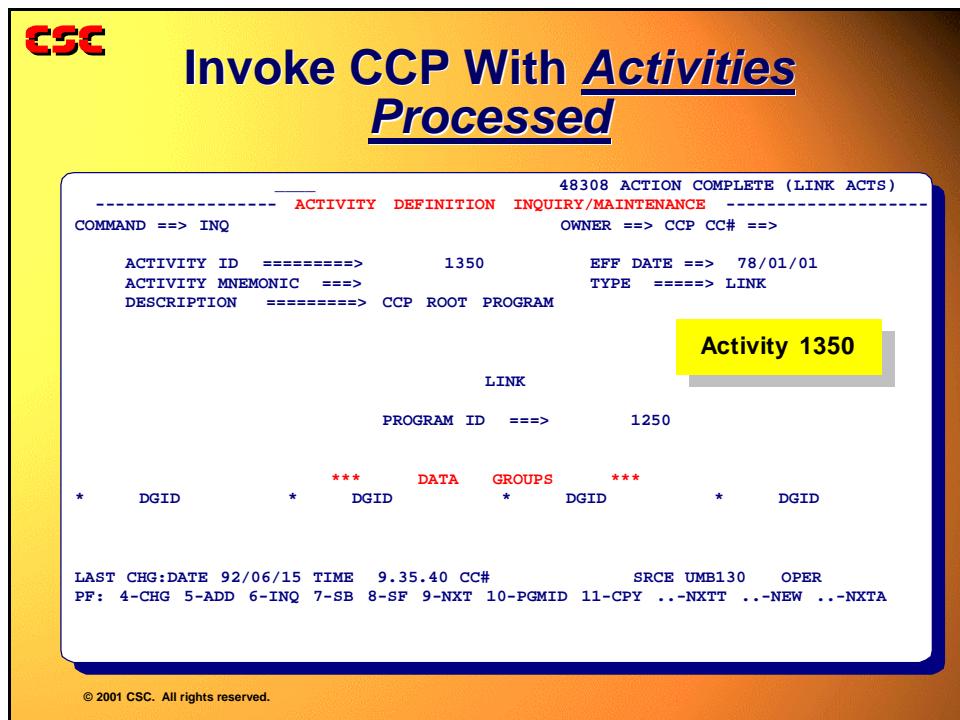

Umbrella Programming

Condition Code Processing Capabilities

Invoking CCP

There are basically two approaches for invoking CCP. An application program can link directly to CCP at the time of the exception. Alternatively, the application program can set a condition code that is passed back up the calling chain to a program that centrally processes exceptions by linking to CCP.

When activity 1350 is used, all activities are executed in the sequence in which they appear on the CDMF 1301 entry. An activity such as dump and end processing can be issued.

Notes:

When processing is invoked using activity 1398, the activities are not executed.

CCP Item Key

The slide features a yellow-to-orange gradient background. In the top left corner is the red CSC logo. The title "CCP Item Key" is centered in large blue letters. Below the title is a bulleted list of key components. To the right of the list is a graphic of four stylized human figures standing behind a large blue plus sign. At the bottom left is a small copyright notice: "© 2001 CSC. All rights reserved."

- Key by
 - Language Code
 - Application Code
 - Condition Code
 - Environment Code
 - Source Code
 - CCP Item Data
- 10 activities
- Message text
- Message meaning

CDMF format 1301 has a five-part item key.

- LANGUAGE CODE
- APPLICATION CODE
- CONDITION CODE
- ENVIRONMENT CODE
- SOURCE CODE.

Language Code is a 3 character valid ISO language code value. The application code is a two digit number assigned to a specific application system, such as, 88 for UES. Environment code is not currently used. Source code is 3 for online and 4 for batch. If you are processing online and there is no condition code defined with a source of 3, CCP will use the message defined for source 4. The application code and the environment code will both default to binary zeros if they are not set by the application program.

The application programmer or designer sets up a condition code that must be a unique number within the application code grouping.

The originating program field is for documentation.

Umbrella Programming

Condition Code Processing Capabilities

Note that up to 10 activities can be issued from a 1301 entry. Any activity defined to the Process Dictionary can be issued. Most frequently the activity would be a link or a dump. Remember that if activities are issued from the exception entry on CDMF 1301, the link activity to CCP that must be used is activity 1350.

The message field provides for an explanation of the exception. It is picked up by FPS and PEM formatted dumps. There are six additional lines to expand on the meaning of the message. These lines can be used on help screens.

Notes:

CDMF Format 1301

Format Item Maintenance

The purpose of this section is to discuss a typical CDMF 1301 format entry and review the data stored on it. Below is a sample entry.

Target Data Group

The first important data on the format definition for CDMF format 1301 is the target data group. Under the new technology, data group 48551 is the target data group.

Data group 1301 had been the target data group associated with the old technology PCD. To accommodate application programs written under the old technology, PEM assumes that any condition code that has an application code of binary zeros was created under old technology. It copies the information in data group 48551 to data group 1301 so that application programs that reference data group 1301 can continue to do so.

Programmers writing new applications under the new technology should reference data group 48551 rather than 1301. If the application code is not zero, there will be no entries in data group 1301.

Processing Flow

Fields Set by Application Program

If CCP used normal PCD processing, an application programmer would code the access to a CDMF format as covered in the previous section of this class. Because CCP is heavily used throughout Hogan, it has fewer requirements for setting key fields and actually accessing CDMF 1301—and the rules are different.

The application program sets up two fields in the TCB that will be used by the CCP system. These fields are:

- TCB-USER-CC
- TCB-USER-CC-APP

CCP picks up TCB-SOURCE-TYPE. TCB-USER-ENVMT is available for future use.

Problem Specifications—CCP

Create CDMF 1301 Entry - Phase I

1. Create an entry on CDMF 1301 for condition code 99xx (where xx is your group number). The key is language ENU, application 99, condition code 99xx, environment 0, and source 4. This entry should issue activity 14 and contain a message that you define.
2. Insert logic into your version of the skeleton program to handle the following situation:

```
If employee number (EMP-KEY-ID) 12346 is found,  
issue the condition code you defined on CDMF 1301.
```

3. The TCB data element defined by the COBOL data name TCB-USER-CC is used to pass the condition code to CCP. It is a binary field. You will also need to set the application field (99) for CCP in the TCB, TCB-USER-CC-APP.

Note: You should not change TCB-SOURCE-TYPE as it is a system-maintained field.

4. Determine the activity you need to use to link to CCP. Examine your program to see if the activity has been defined. If necessary, modify the program and program definition.
5. After CCP has been invoked, place the message for that condition code in EMP-POS-DESCRIPTION. This message will be contained in data group 48551, which you need to add to your program definition, Linkage Section, and USING statement. Therefore, you will need to perform the following steps:
 - Add DG 48551 to your program definition.
 - Include the copybook, module U48551D, in the Linkage Section of your program. A copy of the copybook is included on the previous page.
 - Add CCP-CDMF-MASTER to your USING statement.

Make sure that these three additions are in the same position relative to the other data groups.

Because your CDMF 1301 entry also issues activity 14, a dump will be generated by PEM after your report is printed.

Remove Activity 14 from CDMF 1301 Entry - Phase II

1. After you run the job successfully and review the dump, change your condition code by removing activity 14. In subsequent executions of the problem, you will not want to cause a dump.

Summary

CSC

Summary

- Condition code processing gives standard approach to user-defined processing exceptions
- Condition codes contained on CDMF format 1301
- Item key for format 1301
 - * Language code
 - * Application code
 - * Condition code

16

Umbrella Programming

Summary

- Condition Code Processing gives a standard approach for handling user-defined processing exceptions.
- Condition codes are contained on CDMF format 1301.
- The item key for format 1301 consists of: Language Code, Application Code, Condition Code, Environment Code, and Source Code.
- There are two link activities to CCP: 1350 if activities are issued from the 1301 entry and 1398 if no activities are to be executed.
- The control data group for CCP is set up internally when an application program links to CCP. Key fields within data group 48551 are moved from TCB fields, including TCB-USER-CC, which are set by the application program.
- Data can then be accessed by the application from the appropriate fields of data group 48551.

Notes:

Objectives

Objectives

To become familiar with:

- Two sources for looking up a PEM message
- PEM message on a SMART header screen (CIS)
- Key parts of a PEM formatted dump
- PEM formatted dump options set up in batch, CICS and IMS
- Dump option keywords and what they represent
- SMART commands and symbolic addresses
- PEM formatted dump example
- Research of several PEM formatted dumps

© 2001 CSC. All rights reserved

CSC

1. To identify two sources for looking up a PEM message
2. To identify the PEM message on a SMART header screen (CICS)
3. To list key parts of a PEM formatted dump
4. To explain how PEM formatted dump options can be set up in batch, CICS, and IMS
5. To list the dump option keywords and describe what they represent
6. To discuss the SMART commands and symbolic addresses
7. To walk through an example PEM formatted dump.
8. To research several PEM formatted dumps.

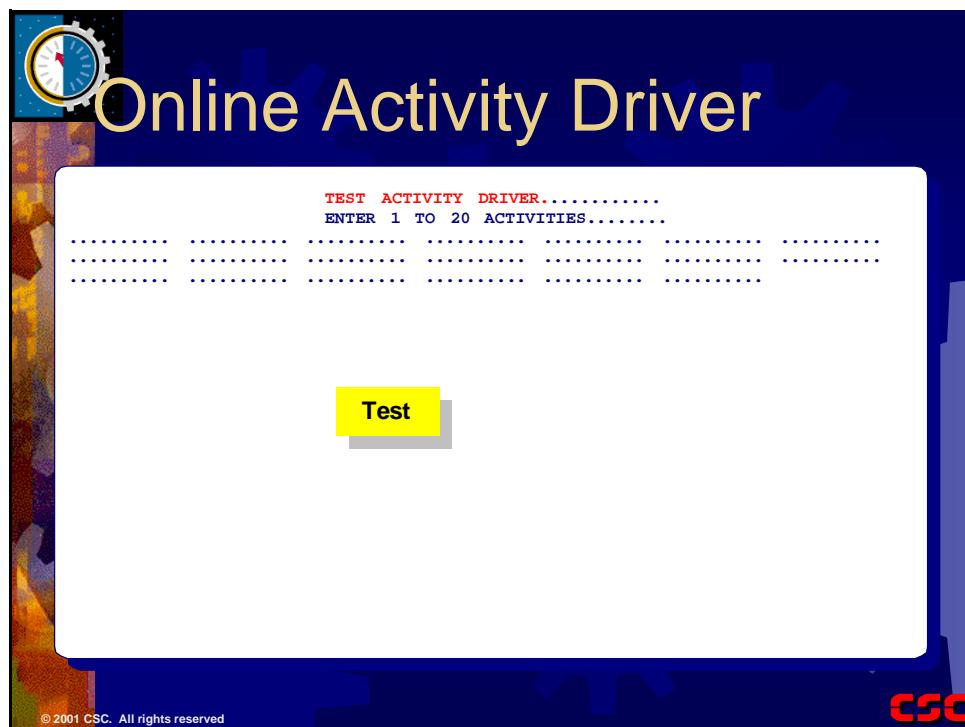

Testing

Activity Driver

The activity driver transaction can be used to execute 1 to 20 activities that require no data group or TCB parameters. It is normally used during testing or debugging so that selected activities may be executed to test a transaction. It may be used both online and batch.

Online Operation

The activity driver can be invoked online through TEST. Obtain the proper screen by issuing the TEST transaction. The following panel image will appear.

Enter the activities to be executed in the order you desire and press ENTER. Note that, in an IMS/DC environment that uses response mode, a data communications display is necessary to unlock the terminal. Activity number 911 can be used to display back the screen if no display activity will be included in the list of activities.

Batch Operation

Prior to CDMF technology, the activity driver was critical for testing. The transaction definitions were maintained in a table that had to be reassembled when a new definition or change was needed. The activity driver provided a programmer with a means for testing the transaction before modifying the table.

The batch activity driver is issued by SYSIN cards in the following format:

```
//SYSIN DD *
 1 49 904
 #905@ ACT1 @ ACT2 @ ACT3 @1@%
```

Up to 20 activity ID's can be listed. No spaces are included around the activity number because blanks are not valid input for numeric fields.

**** NOTE **** If you do not end the activity list with an activity that will either end the program or the transaction, the activity driver program will issue a read activity for an additional 20 activities. This will produce unwanted results in any environment. Therefore, it is recommended that activity 1 always be the last activity in the list.

Notes:

Testing, Debugging, and Dump Activities

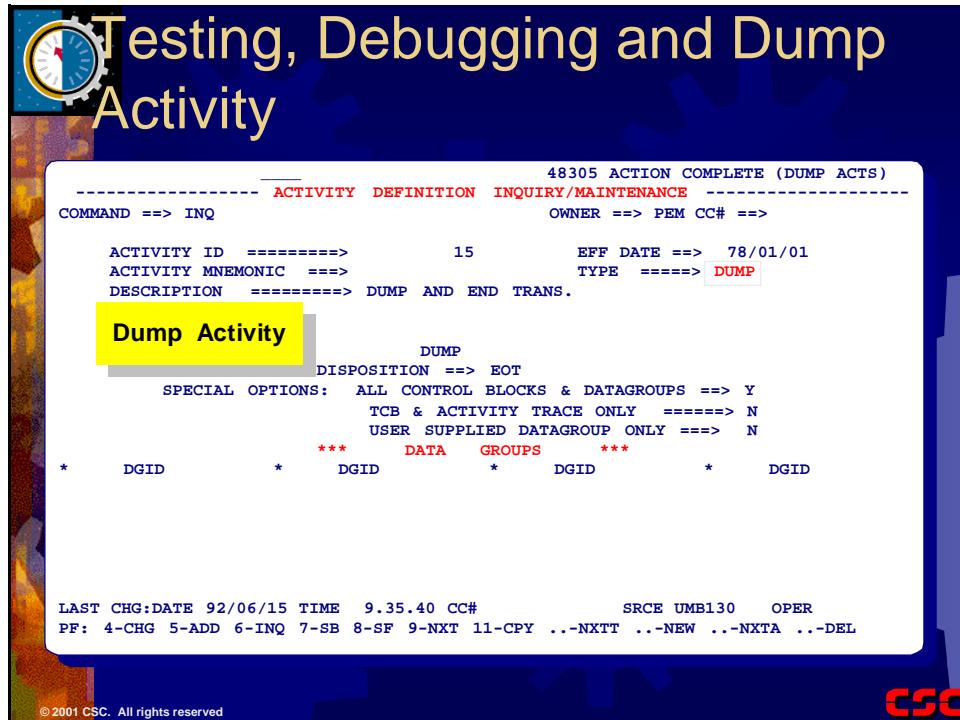

Dump Activity

The DUMP Activity allows the application program to get a PEM formatted dump of selected areas of storage. The data that is formatted in these dumps is controlled by the dump options set at PEM generation time. There is a special transaction available that allows you to override these options.

Several processing options can be specified by the Dump activities.

Predefined activities for dump

- ACTIVITY 14—FULL DUMP DISP=WAIT.
- ACTIVITY 15—FULL DUMP DISP=EOT.
- ACTIVITY 16—TCB DUMP ONLY DISP=WAIT.
- ACTIVITY 17—USER SUPPLIED DATA GROUP ID, DISP=WAIT.
- ACTIVITY 18—USER SUPPLIED DATA GROUP ID, DISP=END.

Exception Activity

The exception activity enables the user program to log exception messages using the internal PEM mechanism for exceptions. An MVS condition code can also be set as the job step condition code in OS/VS batch environments. A data group can be specified to contain a message for the exception. Data base rollback can be requested. The PEM mechanism for exceptions is different for each environment.

For online processing, messages are displayed to the terminal that originated the transaction and logged either to the online journal file or the master terminal. In batch processing, messages are written on an exceptions report.

Data Base Rollback Request

If coded on the exception activity, a rollback request causes data base updates to be backed out. In addition, it sets the job step condition code and prints a message.

Note: The rollback of data base updates will only take place in environments that support rollbacks, such as IMS/DC, BMP, or CICS with DTB support. PEM does not log before/after DB images for rollback use.

Delivered Exception Activities

- Activity 22—CC=00,DG=0,DISP=WAIT, user-supplied CC only.
- Activity 23—CC=00,DG=9,DISP=WAIT, user-supplied CC and MSG in data group 9.
- Activity 24—CC=12,DG=9,DISP=EOT,ROLLBACK=YES MSG in data group 9 and EOT.
- Activity 25—CC=00,DG=9,DISP=END, user-supplied CC and MSG in data group 9. End program.
- Activity 26—CC=00,DG=9,DISP=EOT. Same as activity 25 with EOT.
- Activity 27—CC=12,DG=0,DISP=WAIT. Set CC=12.
- Activity 30—CC=00,DG=0,DISP=WAIT,ROLLBACK=YES. Rollback only.
- Activity 33—CC=00,DG=9,DISP=EOT,ROLLBACK=YES. Rollback only.
- Activity 35—This link activity invokes a program that fills in the message number of data group 9 with the value from the Transaction Control Block field, TCB\$USCC (ASSEMBLER) or TCB-USER-CC (COBOL). The message text is then obtained from Condition Code Processing PCD 1301. Exception activity 39 is issued to abend with the exception message.
- Activity 39—CC=12,DG=9,DISP=ABND, MSG in data group 9 and abend.

Note: Because the name of the program issuing this activity is displayed on the front of the message, the message description on PCD 1301 should not exceed 35 characters.

Exception Activity Vs Dump Activity

The slide has a dark blue background with a large gear graphic on the right. In the top left corner is a small icon of a gear and a clock. The title 'Exception & Dump Activities' is in large white font. Below the title is a bulleted list of activities:

- Activity 35 = dump and die
- Activity 35 = link activity
 - TCB-USER-CC with PCD 1301 indicates specific abend error
 - Activity 35 = causes PCD 1301 to be read
- Activities 14 and 15 = cause dump to file
 - Activity 15 = ends the transaction
- Activities 12 or 35 ABEND and cause smart screen display

At the bottom left is the text '© 2001 CSC. All rights reserved.' and at the bottom right is the CSC logo.

The preferred approach to end a transaction and cause a dump (dump and die) is to issue activity 35. Activity 15 is a dump activity that ends a transaction. While activity 15 can be used in testing, it should never be used in production because it does not set a return code for the operator.

Activity 35 is a link activity to a program that issues the exception activity 39. TCB-USER-CC is set to a condition code defined to PCD 1301 to indicate the specific abending error. Activity 35 causes PCD 1301 to be read, the message to be moved into data group 9, and the response code to the operator to be set to 12 for the step.

Activities 14 and 15 are supported online and cause a dump to the dump file. In the CICS environment, this eliminates invoking a SMART screen. Use either activity 12 or 35 to cause a SMART screen.

Notes:

Dumps

Dumps: Friend or Fiend?

Every data processor has generated a dump. Some are easier to solve than others. PEM creates a formatted dump that eases the solution of an abend.

PEM will generate a dump on an abend condition or when a dump activity is issued. The dump is identified with labels for important components. An error message is printed.

How to Approach the Abend

Knowing what caused the problem helps solve it. The first thing to do is to read the PEM message. Many problems can be solved without looking at any HEX output. Review the message to help identify where the problem occurred.

PEM messages are identified with a five digit number in the 49000 range. There are two sources for looking up the message. Umbrella System Messages and Codes Manual provides a listing of the messages and an explanation of their meanings. The messages are also stored in an online table, CDMF format 1301.

Dump Methodology

1. Examine Exception Message Number is CCP 1301 CCP Key
2. Common Error Message Section
3. Activity Trace Table
4. Process Dictionary Displays
5. Source Code - Use Activity Trace

Common Error Messages

The following messages relate to common problems encountered when first working with the Umbrella System:

PROBLEM	POSSIBLE CAUSES
49005 LOAD FAILED FOR Z999913	COBOL program not compiled. Linkname on program definition is different from the name used to linkedit the program to the LOADLIB. The JCL points to wrong LOADLIB.
49006 TRANSACTION NOT DEFINED	The SYSIN CO/APP/FUNC invalid. Transaction definition was not defined.
49008 ACTIVITY NOT AUTHORIZED	Activity not on the program definition. Activity ID loaded to TCB-LONG-ACTIVITY contains the wrong value. Activity ID defined as halfword (fullword program).
49017 PROGRAM NOT DEFINED 00000047913 850731	The program ID specified on the link activity has not been defined. The program ID specified on the link activity is wrong.
49049 DG-47130 NOT IN DB- EMP	The order of data groups on data base activity is not the same as the data base definition. The data group is not part of the data base. Only data groups from the same data base may be specified on the HDB activity. The program ID specified on the link activity is wrong.
49057 ACTIVITY NOT DEFINED	The activity definition for the activity issued has not been defined. The activity ID issued is wrong.
49088 ACTION 007 CONFLICTS WITH USE. DG47110	Positional data groups are non-keyed and cannot be accessed with a KEY action code. Sequential actions cannot be used with random uses.

Umbrella Programming

Common Error Messages

PROBLEM	POSSIBLE CAUSES
S0C4 PROTECTION EXCEPTION (IF PSW IS WITHIN THE APPLICATION PROGRAM)	Data group referenced in COBOL program but not defined in the program definition. Dynamic data group referenced prior to allocation. The order of the data groups in the program definition, COBOL linkage section and the Using Statement are not the same. Data group length in COBOL program is greater than the data group definition. Data base access involving the last activity issued has not completed successfully.
S0C7 DATA EXCEPTION	The order of the data groups in the program definition, COBOL linkage section and the Using Statement are not the same. Data group not field initialized. Access to data in data group with DG-RESULT not DGR-OK. Logic error.

Notes:

Dump Options

Option Keywords—Batch

Several special options are shown below.

KEYWORD	DESCRIPTION
DUMP	SYSUDUMP
NOPDUMP	NO PEM dump, suppress PEM abend recovery support. SYSUDUMP/partition dump automatic.
TEST	Test mode allows some exceptions to continue.
MON	Start Umbrella monitor.
=XXXXX	Force an abend when exception XXXXX occurs. Only one exception can be active at a time for this option.
<pre>//PEMPARM DD * DUMP, TEST or MON or DUMP, MON /*</pre>	

PEM Formatted Dump Options

PEM produces a formatted dump when an abend or dump activity occurs. The dump process automatically prints a dump header. The application-related data includes a formatted user transaction control block (TCB), a list of recent activities, the registers at abend, and the contents of all allocated data groups.

This dump will also format PEM control blocks, based on parameters carried in the PEM vector table (PVT). Normally, most of these control blocks are not needed to solve problems. To simplify and shorten the dumps produced, PEM is distributed with options set to dump only the ITCB, UPCB, and PVT. The default dump options are set when PEM is generated.

It is sometimes necessary to change the dump options only for the duration of a transaction or job. In this situation, a transaction may be run to change the default dump options. For batch environments, include this transaction:

```
1 49 707
#7@ OPT1 @ OPT2 @ OPT3 @ ... @%
```

Umbrella Programming

Dump Options

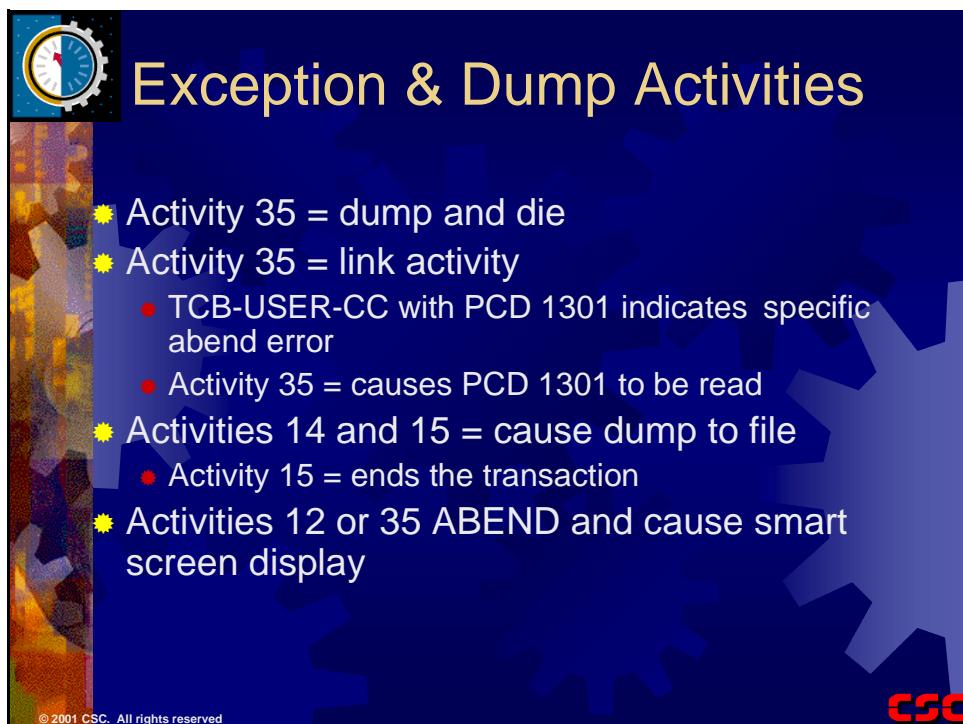

Online Dump Options

Using the PEMR transaction, you can turn the monitor utility on in an online region. During installation, default dump options are set. TS06 can change the options.

To obtain the input screen from a cleared screen, enter:

TS06

The dump options screen appears as follows:

Enter the desired dump options and press ENTER.

Options MON, USAGE, NOMON, and NOUSAGE may be set from this screen.

CAUTION:

The monitor tracks the executing activities, the EXCPs, the time used by the activities, and the issuer of the activities. This information is written to a sequential file that becomes input for batch reports. Monitor should be used during low-volume, controlled periods. The prompt for IMS is TS06 or /FOR P49707MM. If monitor is to be activated, the monitor data set must be added to the message region.

Umbrella Programming

Dump Options

The keywords turn on a given option; to turn off an option add NO to the keyword (for example, NOPVT prevents printing of the PVT in the dump). Unless the combination of options used resets the default options, those options will remain in effect. The reset is additive, not a complete replacement.

PEM is distributed with options set to dump only the ITCB, UPCB, and PVT. Some examples of the other options and descriptions are listed below.

<u>KEYWORD</u>	<u>DESCRIPTION</u>
ACTS	Activity definition index and tables.
ALL	Set all options.
CDMF	All Common Data Management Facility indexes, tables, and work areas hierarchical data base company table.
DBWA	Data base work areas.
LOAD	Load module table.
PCB	DL/I PCD list.
PEM	PEM load module.
PGMS	Program definition index and tables.
PVT	PEM vector table.
SORT	Sort activity work area.
TRAC	Activity trace table.
UPCB	User Program Control Block.

Dump Options

System Memory Access Retrieval Tool (CICS)

Included in the CICS version of the Umbrella System is the System Memory Access Retrieval Tool (SMART). SMART can run stand alone or as an abend exit of a PEM transaction. The SMART header display contains the last command, CICS abend, PSW, abending program ID, registers, the last 10 executed activities, formatted TCB and PEM exception message. Using a facility called PEM Formatted System Dump or PFSD for short, you can send the dump to a sequential file for later printing in batch.

The following is an example of a SMART header screen which is generated with the Tran Code “Kore.”

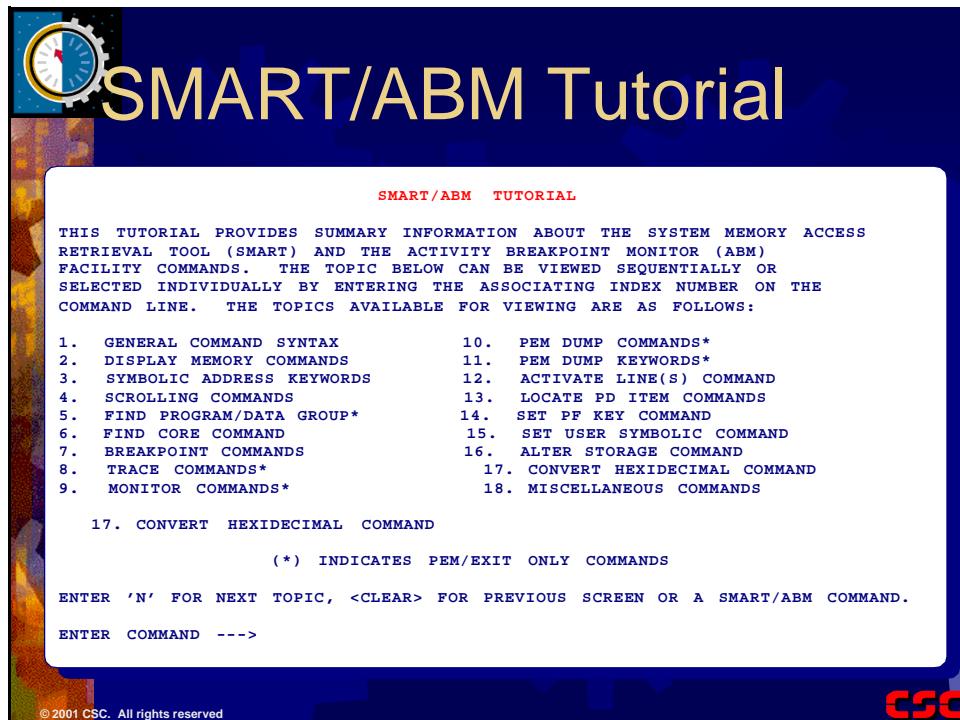

Notes:

System Memory Access Retrieval Tool

SMART/ABM Tutorial

The following screen is displayed using the SMART Command of H or HELP. The main menu contains a list of SMART command summary topics that can be selected specifically or sequentially as listed. Each topic provides a summary descriptions of SMART commands and facilities with command syntax and examples. Specific topic viewing is initiated by entering the topic number, from the menu, on the COMMAND line. To view the next sequential topic, enter N on the COMMAND line, from any of the tutorial screens, and press ENTER. The tutorial can be terminated from any screen by pressing the CLEAR key. This will cause a return to the screen prior to entering the tutorial.

Notes:

SMART Commands and General Syntax

Aside from the initial SMART screens, the data and/or screens displayed are controlled by operator entered commands. The actual commands are discussed in detail later in this section, but the basic command syntax is:

OPERATION <operand list>

where OPERATION is a single or multiple character command code and the OPERANDLIST is one or more command operands required to execute the command.

The delimiter that separates the OPERATION from to OPERAND LIST varies from command to command, however, in most cases a blank, comma (,) or equal sign (=) can be used. Operands within the OPERAND LIST are generally separated by a comma or blank. The commands definitions will define any specific requirements.

The previous command can be repeated by simply pressing ENTER without entering any data on the COMMAND line. This can be useful when tracing a series of pointers that are always at the same offset. For instance, the command I*+4 is entered to trace a series of control blocks.

Most commands require hexadecimal addresses for operands. These addresses may be entered in several ways:

EXPLICIT ADDRESS A 1- to 8-character hexadecimal values representing a valid storage address. Simple arithmetic can also be used with valid values.

Examples:

104
AD8944
1D6+E90
E-4+103

CURRENT LOCATION * (asterisk). Use the current display address.

SYMBOLIC ADDRESS A predefined or user-defined symbol that equates to an explicit storage address. These symbols are used in place of explicit addresses to point to commonly used storage, control blocks, and/or registers.

COMBINED FORMAT A combination of any of the other address formats. Notice that only one symbolic address can be used in a given command and should appear between parentheses.

Examples:

104(PVT)
*+AD8
13DC(ITCB)+1468-C

SMART PF Keys

PF1 => HELP	PF13 => HELP
PF2 => ?	PF14 => ?
PF3 => END	PF15 => END
PF4 => B=SKIP;END	PF16 => B=SKIP;END
PF5 => FD=>	PF17 => FD=>
PF6 => ZAP	PF18 => ZAP
PF7 => @=SB>	PF19 => @=SB>
PF8 => @=SF>	PF20 => @=SF>
PF9 => A=1,10	PF21 => A=11,20
PF10 => P=DUMP;END	PF22 => P=DUMP;END
PF11 => @=ORIGIN	PF23 => @=ORIGIN
PF12 => RETREIVE	PF24 => RETREIVE

Notes:

Umbrella Programming

System Memory Access Retrieval Tool

Symbolic Addresses

Symbolic addresses are used to reference storage areas, within SMART storage display commands, without actually entering the explicit address. The symbols are stored in an in-core table with their associating storage addresses. Within the DISPLAY command, the symbol (once found in the table) is replaced by the associating explicit address before processing. This allows the operator to display commonly used storage areas without concern for their explicit addresses. Considering most storage areas and control blocks addresses change from SMART session to SMART session, this facility simplifies displaying these area considerably.

There are two types of symbolic addresses: predefined and user-defined. Predefined symbolics are setup once SMART is invoked. User-defined symbolics can be added, once a SMART session has begun, to allow individually customized symbols to be used in the same manner. The symbolics predefined in the symbol table depend upon how SMART was invoked. For example, if SMART is invoked as a PEM abend exit, most control blocks and storage areas associated with PEM transactions will be present in-core and will be defined to the symbol table (such as, the TCB and the Activity Trace Table). However, if SMART is invoked by the stand-alone transaction (KORE), none of these PEM storage area and control block will be present. Consequently, the uses of these symbolics will cause the BASE SYMBOL NOT DEFINED message to appear.

Note: When in doubt as to whether a symbol is valid, the symbol table can be displayed. If the symbol appears with no associating address, the symbol is not valid.

No matter how SMART is invoked, some symbolic addresses are always available. These symbols point to common OS and CICS control blocks and SMART work areas. The symbols are:

CVT	Communication Vector Table
EIB	CICS Execute Interface Block (for the SMART Module)
EIS	CICS Dynamic Storage Area (for the SMART Module)
* PVT	PEM VECTOR TABLE
* PEM\$xxxx	PEM Control Blocks (chained off the PVT).

Note: Asterisk (*) denotes PEM storage area symbols that will be present if at least one PEM transaction has executed in the CICS region. This also includes all Process Dictionary data and index table symbolics not prefixed with PEM\$.

The following symbols, CSA, DCT, FCT, PCT, PPT, TACB, TCA, TCT, TCTTE, TCTUA, and TRT, available in previous releases, are no longer valid.

The contents and uses of these control blocks are defined in various CICS publications. Consult your CICS system programmer for additional information.

Umbrella Programming

System Memory Access Retrieval Tool

The following is a complete table of all the predefined symbols:

SYMBOL	DESCRIPTION
ACB	CDMF Application Control Block
ACTS	Activity definition index
CDMF\$PMA	CDMF Pool Management Area
CDMF\$STAT	CDMF Formats Statistics Table
CDMF\$TOT	CDMF Table of Tables
CVT	Communication Vector Table
DG	Data group (variable, reset by FD= command)
DGIX	Allocated data group index
DGS	Data group definition index
DBWA	Data base work area
EIB	CICS Execute Interface Block (for the SMART Module)
EIS	CICS Dynamic Storage Area (for the SMART Module)
EVT	PEM Error Vector Table
ICB	CDMF internal control block
ITCB	PEM internal TCB
MAPS	Map definition index
PEM	PEM load module
PEM\$ALST	Activity definition index
PEM\$APP	Transaction code conversion table
PEM\$CSIX	Common Storage Control Area pointer
PEM\$DBIX	HDB index
PEM\$DGNX	Temporary data group index
PEM\$DVCT	DCT

Umbrella Programming

System Memory Access Retrieval Tool

PEM\$ENQC	Enqueue Chain
PEM\$HCOL	HDB company list table
LOADLIST	PEM load list
PEM\$MAPL	Map index
PEM\$PDG	Permanent data group index
PEM\$PDGC	PERM DGS Index for CSA
PEM\$PLST	Program definition index
PEM\$PSA	Permanent Extended Storage
PEM\$SAML	Sequential data base index
PEM\$SCVT	MVS Subsystem Communication Table entry
PEM\$SITE	Permanent site control data group
PEM\$TBLS	Tabling Statistics Site Permanent DG
PEM\$TCOL	Transactions/maps company list table
PEM\$TLST	Transaction definition index
PGM	Load address of abending program (variable, reset by FP= command)
PGMS	Program definition index
PSB	IMS PSB address list
SYMBOL	DESCRIPTION
PSW	PSW at entry to abend (available only after CICS ASxx abends)
PVT	PEM Program Vector Table
REGS	Registers at entry to abend if SMART is invoked as an abend exit. Otherwise, the registers of the user program.
RSA	Register save area chain

Umbrella Programming

System Memory Access Retrieval Tool

Rnn	Where nn is 00 to 15. When used with the display storage command, this will be a pointer to the register value in storage. When used with the indirect display command, this will be the pointer to the storage area referenced by the register.
SQLCA	SQL communication area
SQLMSG	SQL translated exception message
SWA	Sequential data base work area
TAI	PEM Task Abend Information area
TIN	PEM BMS input/output mapping work area
TRAN	Transaction definition table
UPCB	Current PEM User Program Control Block
UTCB	User Transaction Control Block
UTIN	CICS original terminal I/O area

Notes:

SMART Storage Display Screen

Activity Breakpoint Monitor (ABM)

The Activity Breakpoint Monitor can halt execution of any PEM transaction before, after, or both before and after any or all activities. User commands are provided to select any subset of activities to breakpoint. When a breakpoint is triggered, an ABM screen is presented to the user with all ABM and SMART commands available. Ending an ABM session (with the END command) resumes the transaction at the breakpoint.

This facility also allows trace reports and monitor files to be written from CICSPEM.

Notes:

Umbrella Programming

System Memory Access Retrieval Tool

Using ABM

The best way to start using ABM is as follows:

1. Enter KORE.
2. Enter B=FIRST to ensure that the first activity issued by PEM has a breakpoint set and transfer control to the ABM.

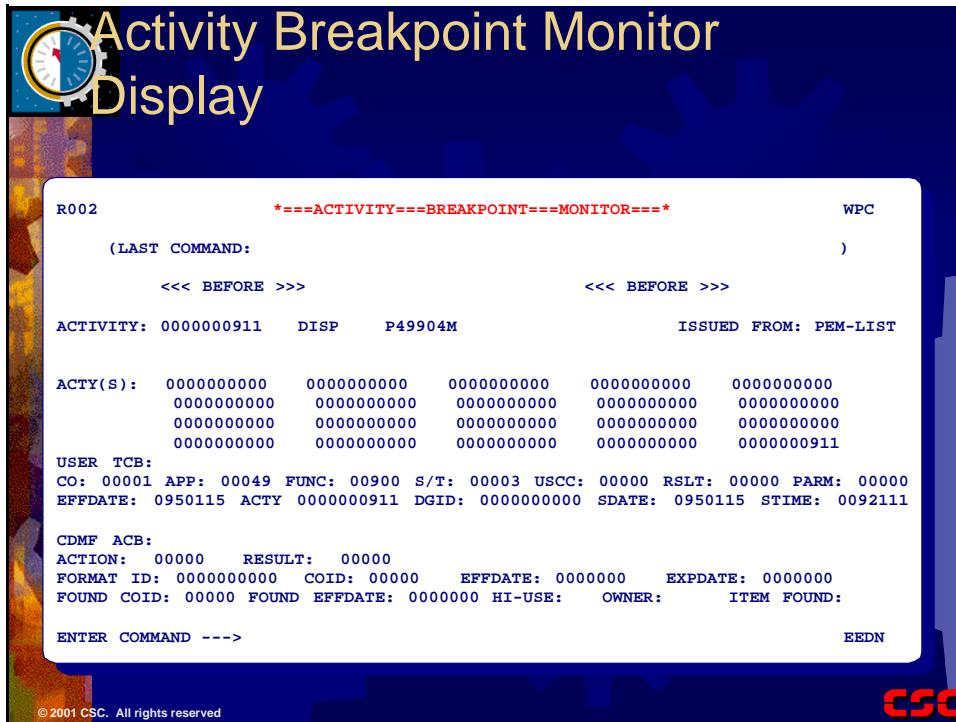

You may also set special PF keys at this time.

3. END the KORE session and enter the Umbrella transaction to be breakpointed.
4. An ABM screen is displayed BEFORE the first PEM activity. At this point you may:
 - Set or reset the breakpoints to a smaller set of activities
 - Enter B=SKIP (default value of PF4/16) to skip all other breakpoints in this transaction (for example, a prompt transaction)
 - Start a Trace report (this automatically skips breakpoints)
 - Start PEM writing a monitor file (breakpoints skipped)
 - Start both Trace and Monitor
 - Enter any SMART commands to examine or alter storage
 - Enter END to end the ABM session.
5. After ending the ABM session, the next session starts. Each activity being breakpointed generates an ABM session. They continue until the transaction ends.

Note: When a DC DISP activity is breakpointed, the screen is displayed for three seconds, then the next ABM session (for example, AFTER display) starts. When the transaction ends, the screen displayed by the DC DISP activity will be redisplayed.

Activity Breakpoint Monitor Display

System Memory Access Retrieval Tool

PEM Formatted Dumps

A PEM formatted dump reduces debugging time. It generates less output. Because each data group is dumped separately there is no need to dump all program storage.

The order of the dump is as follows:

1. SYSIN STATEMENTS TO PEM.

This page contains the SYSIN cards that are source to PEM. These cards identify the PEM transaction that is executing.

2. PEM EXCEPTION REPORT

The header page prints abending time, date, job name, error number, error description, company number, application, function, source type, abending program ID and abending activity ID.

3. FORMATTED DUMP SUMMARY

This page contains summary data for the dump. The PSW at abend is followed by the registers. Next is the abending program ID with offset and abending-while-executing information. The formatted TCB is next. The CDMF Application Control Block has information on the last format (file) processed.

4. TRACE TABLE

The Trace Table lists the last 20 activities executed. The most current is at the bottom of the list. By pairing link activities to end activities, you can follow the activities issued within each of the programs.

5. INTERNAL PEM CONTROL BLOCKS

The Internal Transaction Control Block (ITCB) is in dump format and contains information based on the dump options directly related to PEM.

6. USER PROGRAM CONTROL BLOCKS

Each program executed by the transaction has its own UPCB. The first UPCB listed is the last active program at time of abend. The control block contains the registers of the last call to PEM, address lists, and the program parameter list beginning at offset 000070. The program parameter list contains the positional parameter number followed by the address of the location of the parameter. Positional parameter 00 is the address of the location of the UTCB.

7. DATA GROUP STORAGE

Each data group is printed separately and listed in numerical data group ID sequence.

8. PEM FORMATTED DUMP INDEX

Index cross-references all items in a PEM formatted dump with the page and hex address location within the dump.

Example of a PEM Formatted Dump

The suggested steps for debugging a PEM formatted dump are to examine the parts of the dump in the following order:

1. PEM Exception Report (Header)
2. Formatted Dump Summary
3. Trace Table
4. User PCB
5. Data Group Fields

The instructor will walk through the following example of a PEM formatted dump. The key parts of the dump will be discussed.

Notes:

PEM Formatted Dump Exercises

You are being supplied with a manual that contains four example PEM formatted dumps. The purpose of these exercises is for you to practice debugging some PEM dumps. The examples are designed to present you with a variety of causes for abends.

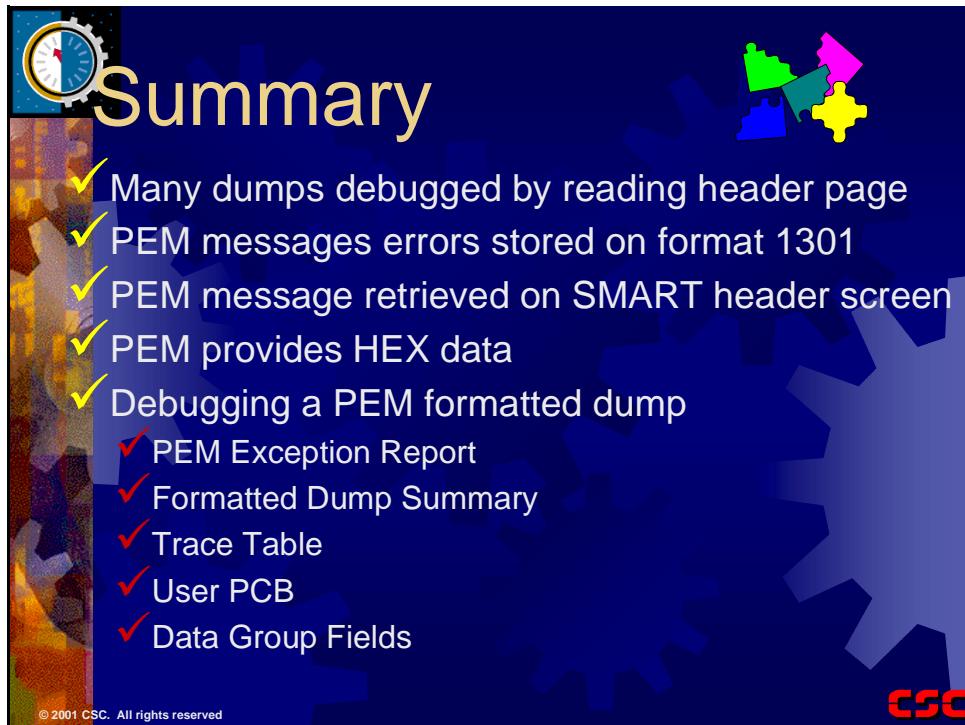

You need to independently research each exercise and attempt to discover the cause of the problem.

The instructor will discuss each exercise along with any questions you encounter in your research.

Notes:

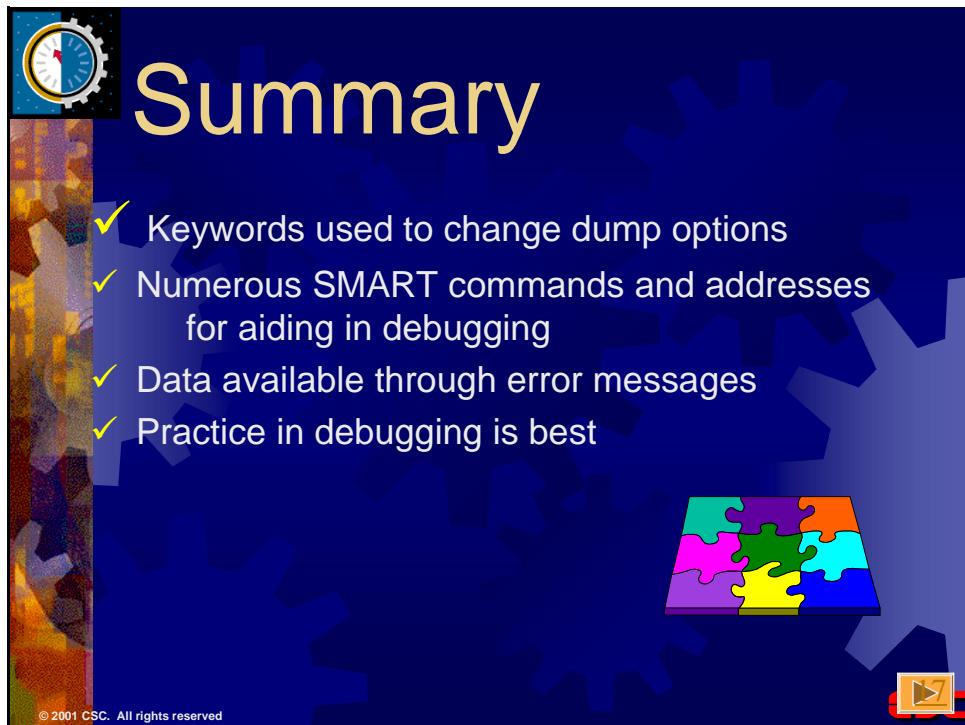

Summary

The slide features a dark blue background with a collage of gears and puzzle pieces on the right side. In the top left corner is a small icon of a gear and a clock. The word "Summary" is written in large, white, sans-serif letters. A vertical list of items follows, each preceded by a yellow checkmark:

- ✓ Many dumps debugged by reading header page
- ✓ PEM messages errors stored on format 1301
- ✓ PEM message retrieved on SMART header screen
- ✓ PEM provides HEX data
- ✓ Debugging a PEM formatted dump
 - ✓ PEM Exception Report
 - ✓ Formatted Dump Summary
 - ✓ Trace Table
 - ✓ User PCB
 - ✓ Data Group Fields

At the bottom left is a small copyright notice: "© 2001 CSC. All rights reserved". The CSC logo is located at the bottom right.

The slide has a dark blue background with a collage of gears and puzzle pieces on the right side. In the top left corner is a small icon of a gear and a clock. The word "Summary" is written in large, white, sans-serif letters. A vertical list of items follows, each preceded by a yellow checkmark:

- ✓ Keywords used to change dump options
- ✓ Numerous SMART commands and addresses for aiding in debugging
- ✓ Data available through error messages
- ✓ Practice in debugging is best

At the bottom left is a small copyright notice: "© 2001 CSC. All rights reserved". The CSC logo is located at the bottom right.

Umbrella Programming

Summary

- Many dumps within the Hogan System can be debugged by reading the header page. There are a few problems that occur frequently.
- The messages for PEM errors are stored on CDMF format 1301. The assigned numbers for PEM are the 49000 range.
- In CICS, the PEM message is retrieved on the SMART header screen.
- PEM provides HEX data in a readable and organized format.
- The suggested steps for debugging a PEM formatted dump are:
 1. PEM Exception Report.
 2. Formatted Dump Summary.
 3. Trace Table.
 4. User PCB.
 5. Data Group Fields.
- Dump option keywords are used to change dump options.
- In CICS environments, SMART provides a look at storage for solving online dumps. There are numerous SMART commands and symbolic addresses for aiding in debugging.
- Valuable data is available and easy to access in PEM formatted dumps through PEM error messages, the formatted TCB, trace table, UPCB, and data group storage.
- Practice in debugging PEM formatted dumps is the best means for learning how to research abends.

Introduction

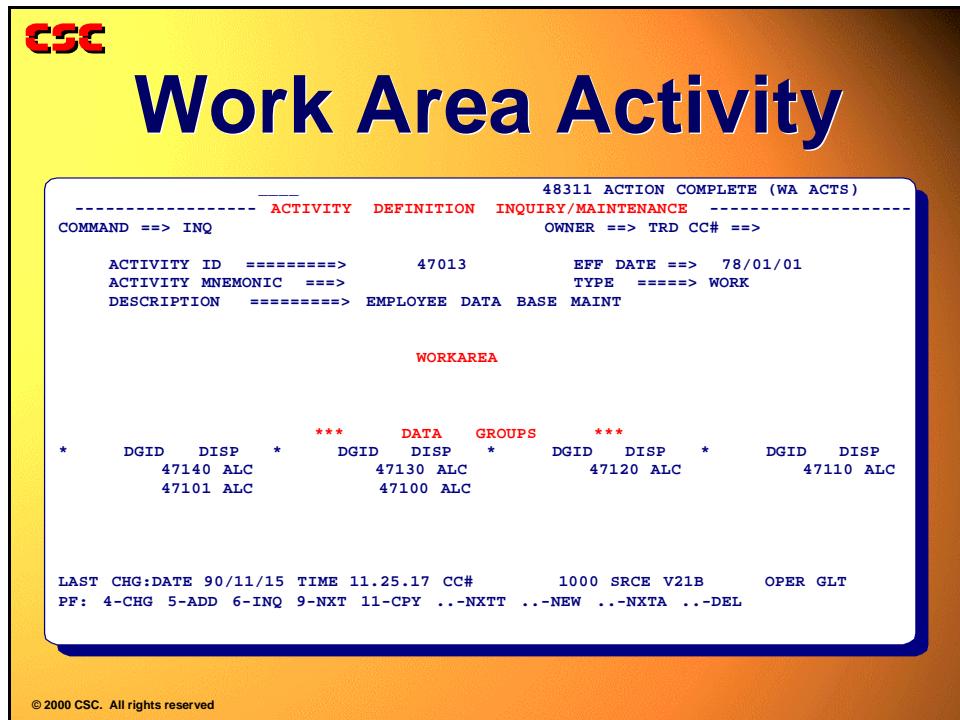

Maps are definitions of screen images that are stored on CDMF, and used by online to format, present, and receive real time data.

There are several additional co-requisite Process Dictionary items required to correctly process a map. Let's begin by examining work area results.

Work Area Activity Definition

Work Area Activities allow the application to allocate, initialize, and release storage areas for data groups. All data groups must have a definition in the Process Dictionary. PEM uses this definition to allocate space for the data group and to initialize the space if so directed. PEM will allocate all the data groups listed in a Work Area Activity in a single area of storage.

A Work Area Activity is required prior to a Data Communications Activity with a service of DBLK (deblock) in order to dynamically establish working storage for the map. An abend will occur if a Work Area Activity has not allocated the data group before the deblocking occurs.

Umbrella Programming

Introduction

Work Allocate Disposition Values

- ALC – If not already allocated, Allocate and Initialize per DG Definition.
- ANO – If not already allocated, Allocate without Initializing.
- REL – Release storage
- INT – Force Re-Initialization

© 2001 CSC. All rights reserved

Notes:

Data Communications Activity

Data Communications Activities provide the application program access to the teleprocessing network and the batch data communications simulator. Two map related services may be performed by Data Communications Activities. Deblock (DBLK) puts data into Data Groups. Display (DISP) displays the contents of Data Groups.

Notes:

Umbrella Programming

Data Communications Activity

Deblock Service

The DEBLOCK service causes PEM to update selected fields in the Data Groups based on input from the screen (if the transaction is online) or SYSIN (if the transaction is batch). During the deblock operation the following edits are performed against the input data:

1. Required field not entered.
2. Non-numeric data in a numeric field, excluding edit mask characters.
3. Numeric data exceeds the field size, that is, overflow.

When the retry option is requested on the DC Activity Definition, PEM displays ? in all the fields found in error and ends the transaction. If retry is not requested, the data is passed as entered to the application program.

Multiple deblock operations may be performed against the same data. This is typically done when key information is required for a Data Base access prior to deblocking the data that may have been changed. When multiple deblock operations are performed, the maps used must describe the fields in the input starting from the first field, that is, the first map may describe the first 10 fields. The second map may describe the first 30 fields. The third may describe the first 50 fields. Each map must begin with field one and continue through field n, where n is the last field you wish to deblock.

Display Service

The DISPLAY service is the reverse of the deblock service. It causes PEM to display selected fields from the data groups to the screen. The fields that are displayed are indicated in the Map Definition.

Display has an optional erase feature. It causes the screen to be erased prior to displaying the data. When erase=no is chosen, the application program should ensure that the map to be displayed is compatible with the current format on a screen otherwise, when the new map is displayed, it could contain characters from the old map. This garbage data can prevent the proper execution of the current application.

A prompt is the display of only the literals on a screen. It results when prompt=yes is set.

The application program can route output to a destination other than the terminal that originated the transaction. This is done by placing the Terminal ID in the TCB-DESTINATION field, and the device type code in the TCB-DEVICE-TYPE field prior to the activity request.

Umbrella Programming

Map Definition Maintenance

Map Definition Maintenance

This section will outline the procedure for defining and maintaining maps. After an overview of the required steps, it will walk through each basic step and define its requirements in more detail.

The following steps are required to define a map to the Umbrella System:

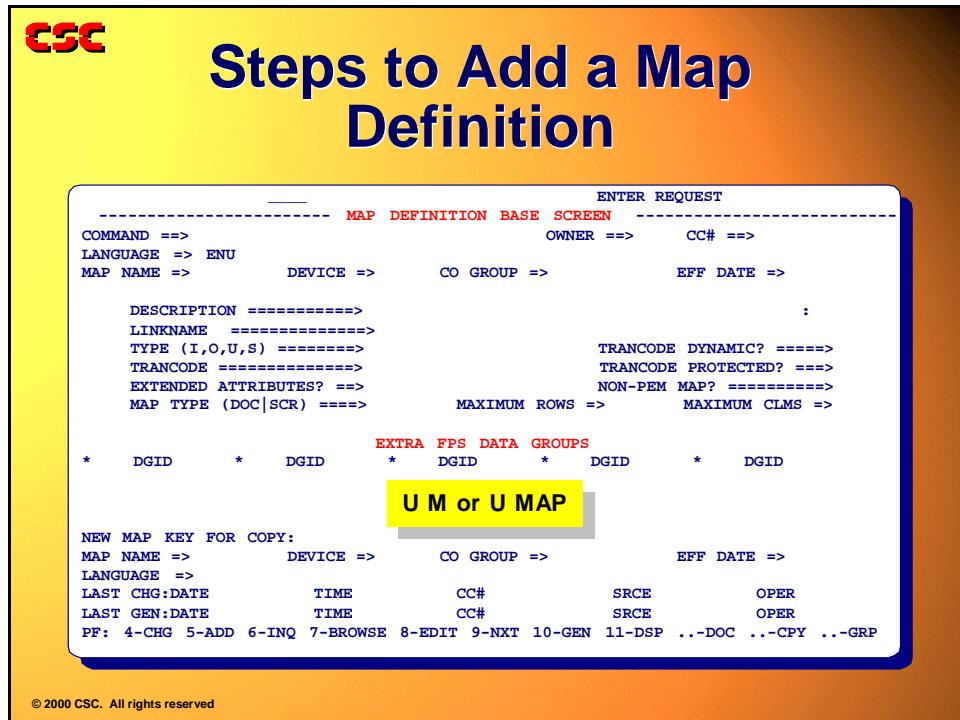

1. CICS users: Add the map name in the CICS PPT or RDO MAP entry.
2. Define the base information necessary to identify the map, including language, mapname, device, title, and linkname. This is done on the "Map Definition Base Screen".
3. Draw a layout of the map on the screen, identifying literals and modifiable fields. This is done on the design screen ("Map Definition Screen"). To display the design screen, press PF8 or enter EDIT into the COMMAND field.
4. Describe the characteristics of the fields identified in the previous step. This includes assigning attributes to all fields, identifying the data elements for the modifiable fields and assigning the edit mask. This is done on the map field definition maintenance screen. This screen is displayed by pressing PF9 or entering FDM into the COMMAND field.
5. If the map is to display repetitive fields, define the fields as groups on the "Map Definition Group Screen". This screen is displayed by entering GRP into the COMMAND field.
6. If the map is to display extended attributes or make use of cursor positioning by the application program, define these on the supplemental "Map Field Definition Maintenance" screen. This screen is displayed by pressing PF6 or entering FDM2 into the COMMAND field.
7. Save the map definition.
8. Generate the map from the base screen by pressing PF10 or entering GEN into the COMMAND field.
9. Run the CICS/IMS map assembly.
10. CICS users: Newcopy the map using the map link name.

Steps to Add a Map Definition

Start with the "Map Definition Base Screen".

Enter U M or U MAP.

Notes:

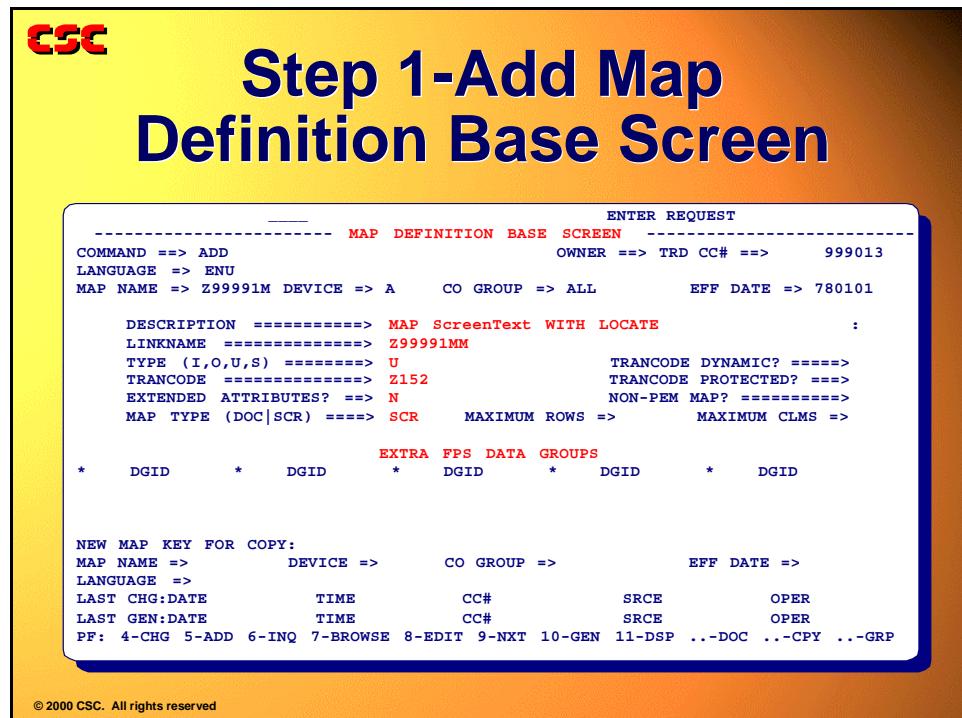

Umbrella Programming

Steps to Add a Map Definition

Step 1—Add Map Definition Base Screen

Enter the base information for the map. Enter the command ADD or press PF5. Because this is an update access, the owner and change control number must be entered.

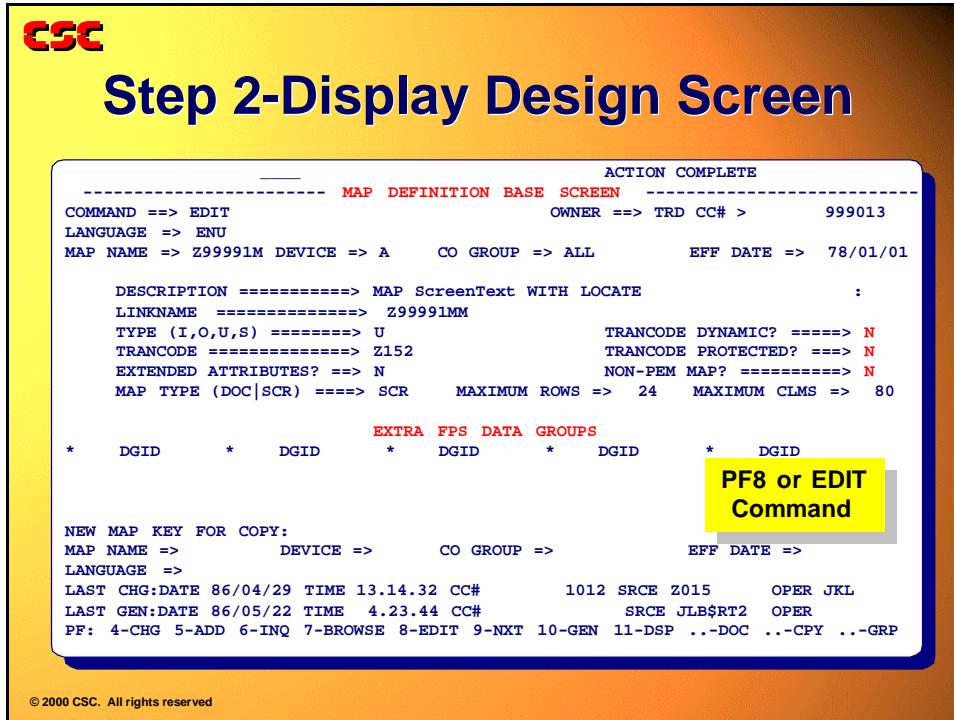

Notes:

Step 2—Displaying the Design Screen

To display the design screen, press PF8 or enter EDIT into the COMMAND field.

Notes:

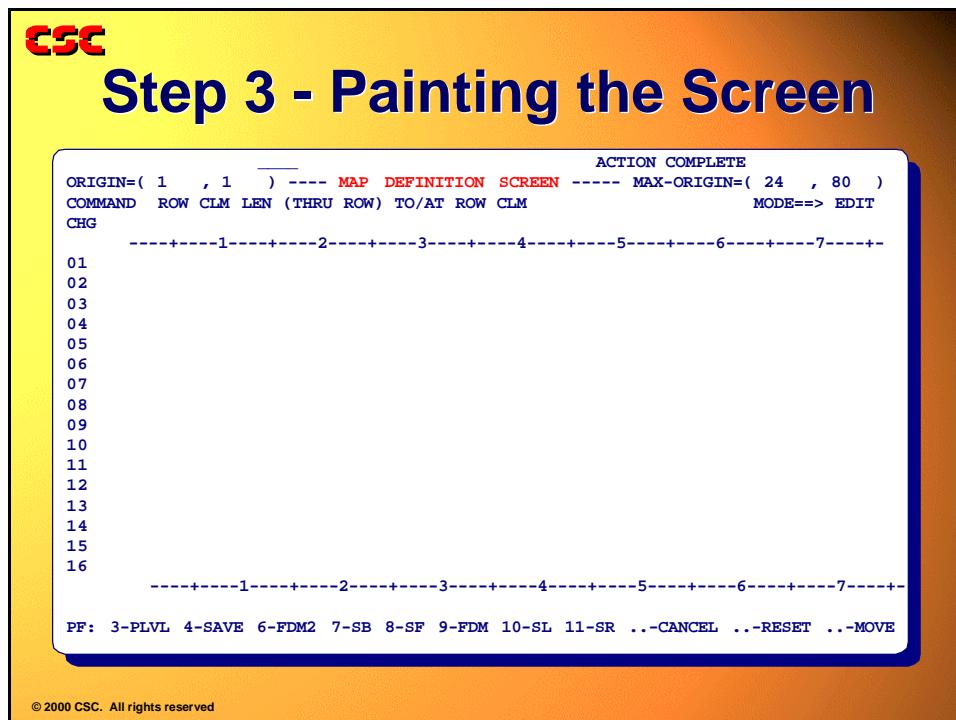

Umbrella Programming

Steps to Add a Map Definition

Step 3—Painting the Screen

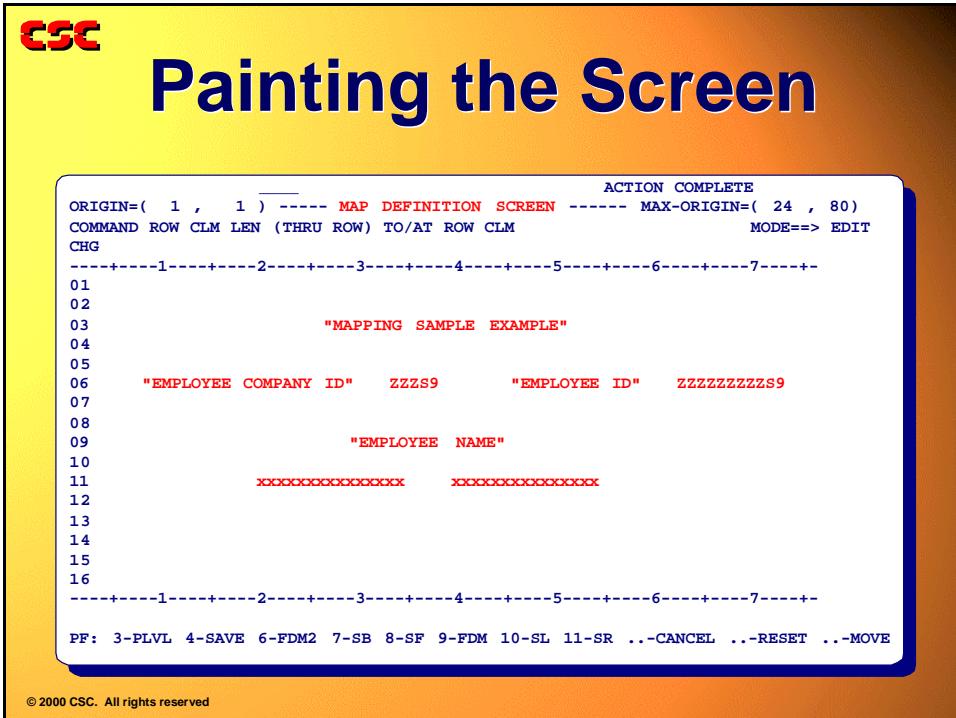

To paint the screen:

- Enter the literals and modifiable fields.
- Indicate the alphanumeric modifiable fields with Xs and the numeric modifiable fields with their edit pattern.

Notes:

Notes:

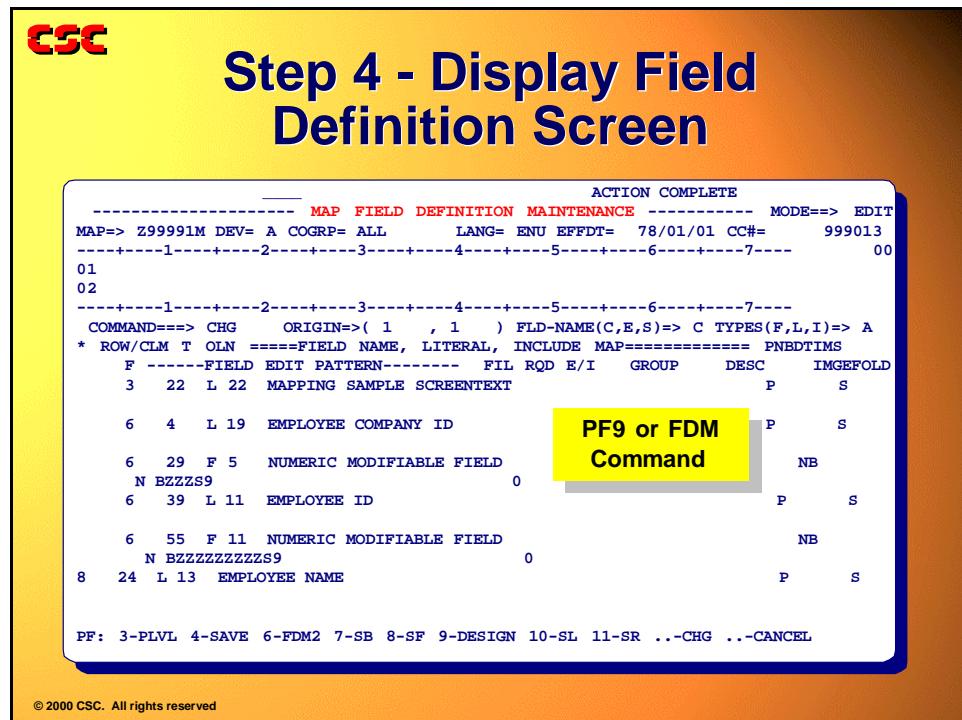

Umbrella Programming

Steps to Add a Map Definition

Step 4—Display the Field Definition Screen

To display the field definition screen, press PF9 or enter FDM in the COMMAND field.

To identify the data fields, change the modifiable fields to actual data group fields.

The screen can be divided into four areas, as follows.

- The key area: Row 3
- The panel image area: Row 4 through Row 8
- The command area: Row 9
- The field definition area: Row 10 through Row 23.

Three rows of the map being defined appear in the panel image area in a format like that of the "Map Definition Screen" design area. The first field in the field definition area is the first field in the second line of the panel image area.

The Command Area Fields:

ORIGIN

This is the row, column of the field definition that is displayed in the first row of the field definition area. This field may be used to position the displays.

FLD-NAME (C,E,S)

This indicates the format type in which the field name is displayed. This field defaults to C.

Valid values are:

- C COBOL name
- E Element name
- S Self-defining name.

TYPES (F,L,I)

This defines the types of fields that are to be displayed in the field definition area of the display. Valid values are:

- A All fields and includes
- F Modifiable fields only
- I Includes only
- L Literal or text fields only.

The Field Definition Area of the display consists of six sets of recurring fields, one per field or include. Each field definition requires two rows on the display. The top row of column headings references the first row of each field definition; the bottom row references the second.

Enter or verify values in the following fields:

* (action)

The action to be performed on this field definition. Default is no change. Valid values are:

- A Add a new field definition.
- C Change the field definition.
- D Delete the field definition.
- L Change the field definition and exit to the data group Data Element Locate Facility.

ROW/CLM

This is the starting row/column of the field being defined.

If this is an include map field (type I), the row specified is the first row in which the included map is displayed.

Umbrella Programming

Steps to Add a Map Definition

T

This indicates which type of field is being defined. The following are valid types:

- F Modifiable field
- I Include map
- L Literal or text field.

OLN

The output or display length for this field. For numeric modifiable fields, this value may be less than the length of the edit pattern, so that only the rightmost digits may be displayed.

FIELD NAME, LITERAL, INCLUDE MAP

For a TYPE = F field, this is the ASSEMBLER, COBOL, or Data Dictionary identifier of the data element to be displayed in this field.

For a TYPE = L field, this is the text or literal.

For a TYPE = I field, this is the name of the include map.

If a modifiable field name is changed or added, the map maintenance program attempts to determine the field's location. If data group definition does not know where that field is, a "Data Group Element Locate Screen" appears with an error message: NO MATCHING ELEMENTS.

Before generation of the map, these fields must be located so the data group and element identifier can be resolved.

PNBDTIMS

This field defines the normal attributes for modifiable or literal fields. An attribute is selected by entering a nonblank character beneath the letter representing that attribute.

The letters PNBDTIMS represent the following attributes:

- P (Protected) The terminal operator is not allowed to enter data in this field.
- N (Numeric) The terminal operator may enter only numeric data: 0 through 9, -(minus),
- B (Bright) Data is displayed at high intensity.
- D (Dark) Data is invisible. (Dark and bright are mutually exclusive.)
- T (Pen Detectable) This field is light pen detectable.
- I (Insert Cursor) Put the cursor in this field location. If multiple fields are

Umbrella Programming

Steps to Add a Map Definition

coded with this attribute, the cursor is placed in the last one.

- M (Modified Data Tag On) The modified data tag (MDT) is on for this field. This causes the value contained in the field to be transmitted as though the operator altered the field when ENTER is pressed.
- S (Skip) Causes the cursor to skip over this field automatically.

F (For TYPE=F entries only.) Enter the format of the field:

- A Alpha, left justified
- C Character, left justified
- L Numeric, left justified
- N Numeric, right justified
- Q Signed numeric, left justified
- R Character, right justified
- S Signed numeric, right justified
- Blank Use format specified on data group definition.

FIELD EDIT PATTERN

An Edit Pattern must be entered for numeric (packed or binary data) fields. Numeric data maintained in display (zoned decimal) format is displayed as character data, and no editing is done.

FIL

Define the fill character with which the TP monitor is to fill the field if it has been only partially entered. For CICS, the only valid values are a blank and zero. If other than these values are entered here, the Map Assembly program for CICS substitutes blank or zero depending on the format of the field.

ROD

Y indicates that this field is always required to be entered.

CAUTION: Any nonblank character entered defaults to Y. A blank indicates not required.

E/I

Error/Ignore. When the user program requests an error display activity, the Umbrella System Mapping System fills each field that contains high values (X'FF') with the Device Suffix Error Code (defined in the Device Characteristics Table Entry). If high values are valid for this field, override the error code fill indicator by entering Y.

Umbrella Programming

Steps to Add a Map Definition

CAUTION: Any nonblank character entered defaults to Y. A blank indicates high values are not valid.

GROUP

This field connects the field being defined with a repetitive field group.

DESC

The 1- to 8-character field description for modifiable fields. The description is used for informational purposes only.

IMGEFOLD

The Umbrella System Image Application Folder name. See "Folder Definition Inquiry/Maintenance Base".

Numeric Field Edit Patterns

An Edit Pattern must be entered for numeric (packed or binary data) fields. Numeric data maintained in display (zoned decimal) format is displayed as character data, and no editing is performed.

Edit patterns for maps are taken from the following places:

- Dynamically modifiable edit pattern (described later)
- Map field definition.

There are two types of edit patterns:

- Standard edit patterns
- User coded edit patterns.

The following are standard edit patterns:

NONE

There is no editing.

\$ An edit pattern is automatically generated at map GEN time to edit a monetary element. Note that PEM is designed to "display blank when zero" when processing "\$" as an edit mask.

\$\$ An edit pattern is automatically generated at map GEN time to edit a monetary element. Note this causes PEM to display significant digits for monetary edit masks.

The following are characteristics of this edit pattern:

- Generated for the specific element size

Umbrella Programming

Steps to Add a Map Definition

- Has two decimal places
- Significance is forced at the decimal point
- Has a trailing dash if negative (ZZS.99-).

/ An edit pattern is automatically generated at map GEN time to edit a number (counter) element. The following are characteristics of this edit pattern:

- Generated for the specific element size
- Significance is forced before the last digit
- Negative numbers are not indicated.

.nn Indicates a date edit pattern. The editing logic flips the standard packed date format of CYYMMDD to the appropriate format, if necessary. The .nn can be:

- .00 The site default.
- .01 MM-DD-YY
- .02 MM/DD/YY
- .03 MM DD YY
- .04 MMDDYY
- .11 CYY-MM-DD
- .12 CYY/MM/DD
- .13 CYY MM DD
- .14 CYYMMDD
- .21 DD-MM-YY
- .22 DD/MM/YY
- .23 DD MM YY
- .24 DDMMYY.
- .50 Causes this field to be edited based upon the settings on the site control "System Site Editing Models" screen. Editing is done by PEM Generalized Editing facility, which needs to be active within PEM if this option is chosen.

Note: Note: SPS has additional options. See "SPS Format Definition" in the chapter "Scheduled Processing System (SPS)" of the Umbrella System Support Systems Programming Guide.

BIN-FW

This field is transmitted as a signed binary length 4 fullword. This is a special edit type for some devices that are processed by terminal input/output exits. The output length must be equal to 4.

Self-Defining Edit Mask.

The is a user-coded edit pattern, and must conform to the following rules:

11. The first character is a fill character. If not present, one is added.

Umbrella Programming

Steps to Add a Map Definition

12. The edit pattern must contain an odd number of replacement digit positions. If not, Z is added at the left.
13. The replacement digits (Z, 9, S) in the edit pattern are aligned right to left with the digits in the numeric field being displayed.
14. Syntax characters:
 - B = Blank
 - S = Significant-start digit position (after this point, display leading zeroes)
 - Z = Zero-suppress digit position (do not display leading zeroes)
 - 9 = Nonsuppress digit position (display all values).
 - Special Symbols S, *, /, %, -, ., , (comma), 0, DR, and CR..

Example:

BZZZ,ZZZ,ZS9.99-	12345678	displays as	123,456.78
------------------	----------	-------------	------------

12	displays as	0.12
----	-------------	------

-1234	displays as	12.34-
-------	-------------	--------

BS9999	12345678	displays as	45678
--------	----------	-------------	-------

12	displays as	00012
----	-------------	-------

-1234	displays as	01234
-------	-------------	-------

- B** Field is bright
- D** Field is dark
- T** Field is pen detectable
- I** Insert cursor here
- M** Modified data tag. The modified data tag causes the value in the field to be transmitted to core even if it has not changed. This attribute must be turned on if you plan to be able to execute a sequential read from your map.
- S** Field is to be skipped.

Step 7—Save the Map Definition

To save the screen, press PF4 or enter SAVE in the COMMAND field of the "Map Field Definition Maintenance" screen.

Notes:

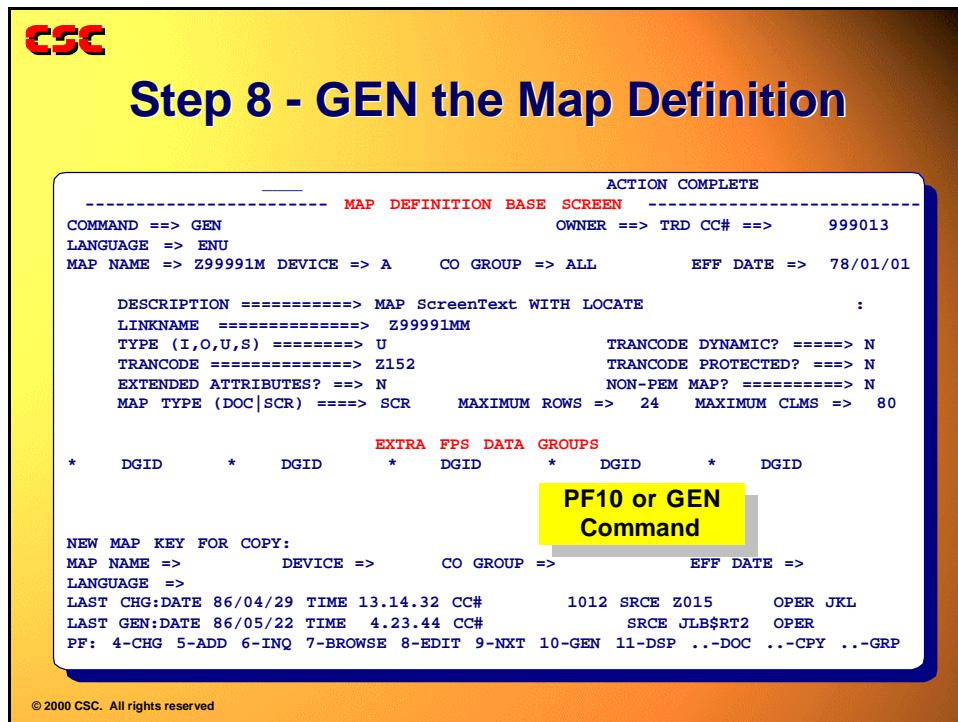

Umbrella Programming

Steps to Add a Map Definition

Step 8—GEN the Map Definition

Generate the map by pressing PF10 or entering GEN in the COMMAND field.

Notes:

Step 9 -Assemble the Map

Batch Map Documenter

The first transaction (1 49 315) generates a batch map documentation report. Two formats of the report are available.

Full format gives the screen image showing the attribute bytes and all variable field locations. Also listed are the field definitions for the map. Diagnostics are produced for error conditions such as overlapping fields, or nested includes.

Screen format gives the screen image only. Attribute bytes and protected fields are not underscored.

This transaction also produces a report of all daughter jobs submitted to the internal reader, as well as a list of the maps contained in the daughter jobs.

```
//SYSIN      DD   *
 1 49 315
#318@@FROMMAP@D@EFFDATE@THRUMAP@_@@OPTION@COGROUP@ISOLANG@%
```

Where:

FROMMAP	1 to 7-character starting map name. If the FROMMAP and THRUMAP names are not the same, (that is, a range of maps is being documented), all maps with a linkname of NONE will be skipped.)
D	A 1-character device code (normally A).
EFFDATE	Effective date. CYYMMDD format (optional).
THRUMAP	1 to 7-character ending map name.
-	The fill character to be placed in the variable field locations. If the printer does not have an underscore (_) character, a period (.) is suggested.
OPTION	FULL or SCREEN.
COGROUP	1 to 8-character company group name. Default is every company group.
ISOLANG	3-character ISO Language code. Default is ENU. This parameter must be specified if other than ENU is desired.

Umbrella Programming

Steps to Add a Map Definition

Batch Map ASSEMBLER

The batch map ASSEMBLER transaction (1 49 303) produces map source statements for the TP environment. Output of the job is written to the MAPSOUT file that is normally the internal reader. The name of the JCL member we are using for the map assembly is CICS. It is housed on the CDMF file. We are using an optional parameter to replace the job card in that JCL member with our own job card.

```
//SYSIN      DD   *
 1 49 303
 #319@@FROMMAP@D@EFFDATE@THRUMAP@TPMON@BBBBB@WWWWW@AAAAAA@
 COGROUP@NBRMAP@JCLMEMB@ OVERRIDE@TYPE@LANGUAGE@ISOLANG@%
```

Where:

FROMMAP	1 to 7-character starting map name.
D	A 1-character device code (normally A).
EFFDATE	Effective date. CYYMMDD format (optional).
THRUMAP	Ending map name. Default is FROMMAP.
TPMON	ID of TP monitor. Enter CICS or IMS.
BBBBB	Optional activity executed before each map. Default is 48808.
WWWWW	Optional activity executed to write map output. Default is 322.
AAAAA	Optional activity executed after each map. Default is 48808.
COGROUP	The 1 to 8-character company group name. The default is every company group.
NBRMAP	The number of maps to be assembled in each job generated. The default is one.
JCLMEMB	The name of the JCL member used to generate the assembly JCL. The default is the system specified (CICS or IMS).
OVERRIDE	Specify if there are override JCL statements in this job stream. If there are override JCL statements, they must immediately follow this parameter statement and must be terminated by an end statement. The format of the override statement is:

NNNNN DATA

Umbrella Programming

Steps to Add a Map Definition

Where:

NNNNN is the sequence number of the job statement.

DATA is the job statement to be generated.

Values for this parameter are:

N No override (default)

Y Overrides follow

A Override all JCL. (Use only the override JCL statements.)

TYPE If the environment is CICS, this value overrides the TYPE parameter on the DFHMSD macro.

LANGUAGE If the environment is CICS and the TYPE Parameter is DSECT, then this parameter overrides the LANG parameter on the DFHMSD macro.

ISOLANG 3-character ISO Language code. Default is ENU. This parameter must be specified if other than ENU is desired.

Notes:

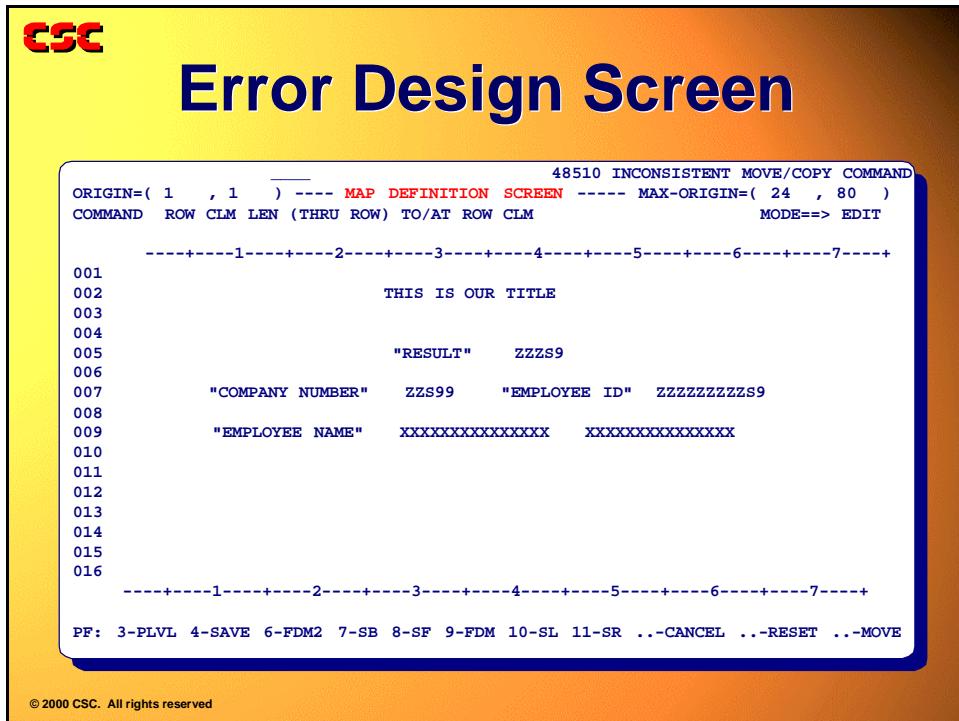

Umbrella Programming

Steps to Add a Map Definition

Map Editor Errors

The Mapping Support System editor will display error messages during your edit session when coding errors are encountered.

Example of Error During Edit Session

The screenshot shows a terminal window titled "Error Design Screen" with the CSC logo at the top left. The window has a yellow background and a blue border. Inside, there is a red error message at the top:

```
48510 INCONSISTENT MOVE/COPY COMMAND
ORIGIN=( 1 , 1 ) ---- MAP DEFINITION SCREEN ----- MAX-ORIGIN=( 24 , 80 )
COMMAND ROW CLM LEN (THRU ROW) TO/AT ROW CLM MODE=> EDIT
```

Below the error message is a code listing with line numbers from 001 to 016. Lines 001 through 004 are blank. Line 005 contains the text "THIS IS OUR TITLE". Lines 006 through 016 contain data pairs: "RESULT" with value "ZZS9", "COMPANY NUMBER" with value "ZZS99", "EMPLOYEE ID" with value "ZZZZZZZZS9", and "EMPLOYEE NAME" with value "XXXXXXXXXXXXXX XXXXXXXXXXXXXXXX".

```
001
002      THIS IS OUR TITLE
003
004
005      "RESULT"      ZZZS9
006
007      "COMPANY NUMBER"  ZZS99      "EMPLOYEE ID"  ZZZZZZZZZS9
008
009      "EMPLOYEE NAME"   XXXXXXXXXXXXXXXX  XXXXXXXXXXXXXXXX
010
011
012
013
014
015
016
```

At the bottom of the code listing, there is a prompt for function keys:

```
PF: 3-PLVL 4-SAVE 6-FDM2 7-SB 8-SF 9-FDM 10-SL 11-SR ..-CANCEL ..-RESET ..-MOVE
```

At the very bottom of the window, there is a copyright notice:

The Map Display Feature

The PF11 or DSP in the COMMAND field of the "Map Definition Base Screen" will display a sample of the map.

Notes:

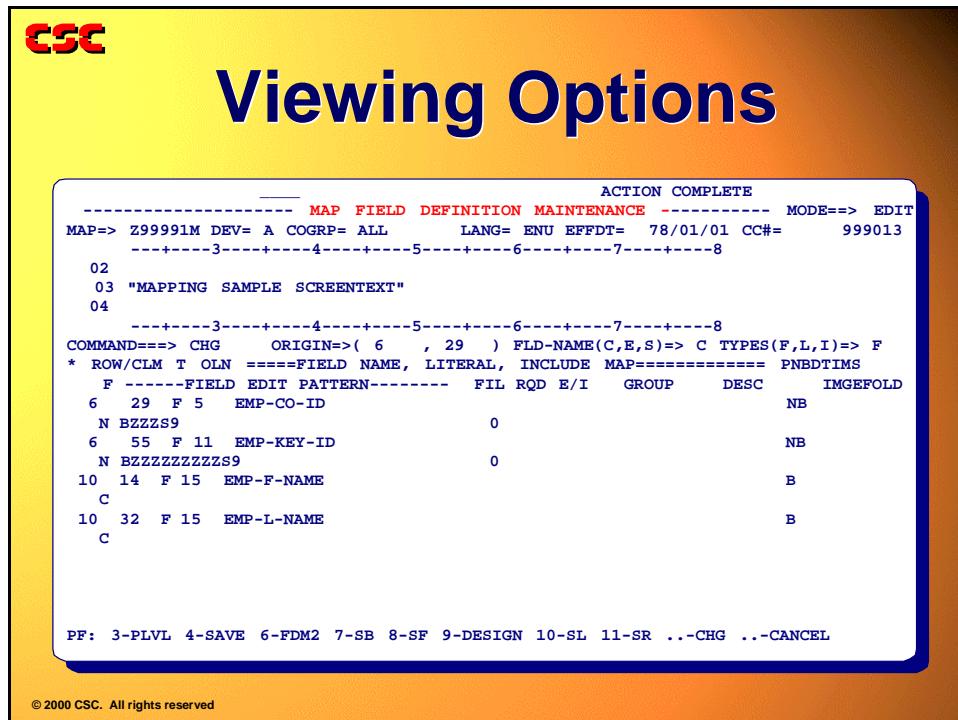

Umbrella Programming

Steps to Add a Map Definition

Viewing Options of Map Field Definition Maintenance

The following shows how to view options on the Map Field Definition Maintenance Screen variable fields.

Notes:

Problem Specifications—Map Definition

Create a Map Definition to display the following information from the Employee data base. Make only the COMPANY NUMBER and EMPLOYEE ID fields modifiable, using the Modified Data Tag attribute. The remaining fields should be protected.

FROM DATA GROUP	DDID	COBOL NAME
DATA GROUP RESULT	47100	TQE47000
COMPANY NUMBER	47100	TQE47001
EMPLOYEE ID	47100	TQE47002
EMPLOYEE FIRST NAME	47110	TQE47102
EMPLOYEE LAST NAME	47110	TQE47101
CURRENT EARNINGS	47130	TQE47303
YEAR-TO-DATE EARNINGS	47140	TQE47403

Data Group Result will contain the value of 7 on a NOT FOUND and the value of 1 on END DATA.

Notes:

Umbrella Programming

Problem Specifications—Map Definition

Suggested Steps for Problem Solution

1. Base information for Map Definition:

MAP NAME: Z999xxM, where xx is your group number.

DEVICE: A

LINKNAME: Z999xxMs (LOAD MODULE NAME), where xx is your group number, and where s is the map suffix (A=MFS,M=BMS).

MAP TYPE: U

TRANCODE: ZxxW, where xx is your group number.

DESCRIPTION: Include your group number in the Map Description field and in the title of the map you design.

2. Design your screen layout
3. Save and GEN your map
4. Submit the JCL to Documentation and Assemble your map.

Notes:

Map Documentation/Assembly JCL

JCL to generate map documentation and assemble the map has been set up for you.
The instructor will tell you the location of the JCL.

Below is a copy of the JCL to generate map documentation and assemble the map.

```
MODULE NAME ZUPCXXMD

//ZUP{J}MD JOB (HOGN,{B},BEF),'MAP DOCUMENTOR',MSGCLASS=9,

```

Notes:

Summary

CSC

Summary

- Process Dictionary houses required information to enable PEM to perform an inquiry function
- Activities should be defined prior to transaction definition
- Screens can be designed and changed quickly
- Standard JCL is delivered
- In CICS, new copy of map required for each change

© 2000 CSC. All rights reserved

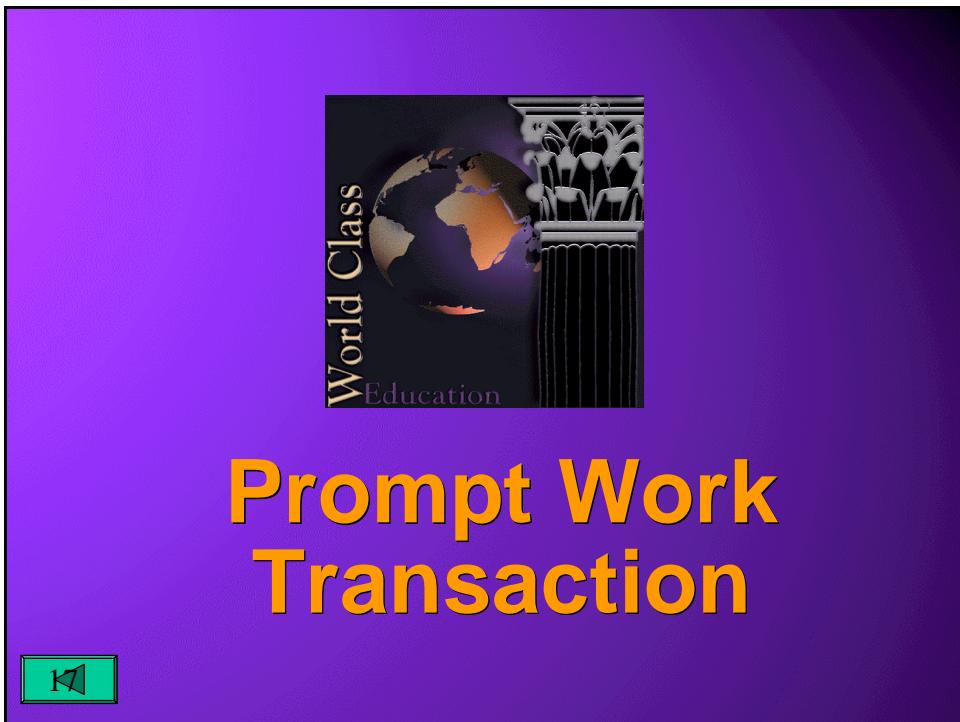

- The Process Dictionary houses the required information to enable PEM to perform an inquiry function on a data base. It is not necessary to invoke a program for an inquiry-only function.
- Activities should be defined prior to the transaction definition.
- Screens can be designed and changed quickly once you become familiar with the mapping facility.
- Standard JCL (for map documentation and assembly) is delivered.
- In CICS, a new copy of a map (or program) is required each time that a change is made.

At execution time PEM would locate the UEPR Transaction Definition and process all of the activities in the list. After the last activity is processed, PEM would free storage associated with this transaction. The UEPR Transaction Definition contains a DC Display activity.

UEPR Prompt Transaction Display

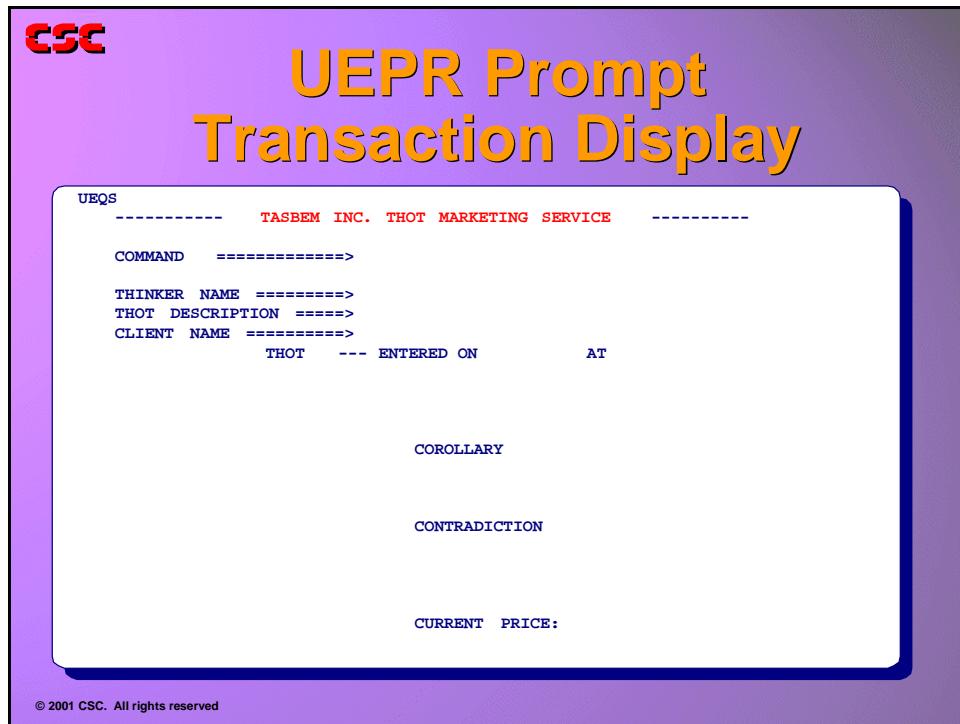

The purpose of the PROMPT transaction is to display the initial formatted screen. With the display of the TASBEM INC. THOT MARKETING SERVICE Screen, the transaction invoked by UEPR is complete.

UEQS is the transaction code formatted on the screen in the upper left corner. If the ENTER key were pressed the UEQS transaction would be executed.

Umbrella Programming

Transaction Activity List Screen

Notes:

Transaction Flow Example

Using the terminal, follow the processing flow of the transaction invoked by UEQS as if you were PEM.

List the Process Dictionary entries in the order they would be accessed during processing.

Locate the Process Dictionary entries as if you were PEM by following the suggested steps below.

1. Locate the Transaction Definition (as illustrated in the online transaction walk through for UEPR.)
 2. Locate each of the Activity Definitions one by one as PEM would. If an activity points to another Process Dictionary Definition, locate that definition. It could be a Map Definition, a Program Definition, or several Data Group Definitions.

Notes:

Problem Specifications—Prompt/Work Transaction

Our user wants online (inquiry only) access to data from the EMP Data Base. You will need to build the supporting Process Dictionary entries to support the users request.

Notes:

Sequential Database Access - Phase I

1. Define the supporting Process Dictionary entries to process the map you defined in a prior exercise.
 - 9991xx, where xx is your group number, Work Area (WA) to allocate the Data Groups referenced by the Map Definition.
 - 9992xx, where xx is your group number, Data Communications (DC) to deblock the data from the screen into the data groups.
 - 9993xx, where xx is your group number, Data Communications (DC) to display the map.
 - 9996yy, where yy is your group number + 20, Data Base (HDB) to sequentially read the Data Base EMP.
2. Define the two PEM transactions on the Process Dictionary. Determine the activities required for each.

PROMPT TRANSACTION	WORK TRANSACTION
APPLICATION ID 99	APPLICATION ID 99
FUNCTION ID 99xx	FUNCTION ID 99yy
SOURCE ID 3	SOURCE ID 3
COMPANY ID ALL	COMPANY ID ALL
TRANCODE ZxxP	TRANCODE ZxxW

Where xx is your group number.
Where yy is your group number + 20.

3. Test the inquiry function using the following steps:
 - Clear screen.
 - Enter transaction code ZxxP, where xx is your group number.
 - After your map is displayed, press the ENTER key. The first employee should be displayed. Note the result code.
 - Press the ENTER key. The next employee should be displayed. Note the result code.
 - Change the company number to 80.
 - Continue to press the ENTER key until the result code = 1 (EOF).

Note: Data Group Result will contain the value of 7 on a NOT FOUND and the value of 1 on END DATA.

Umbrella Programming

Problem Specifications—Prompt/Work Transaction

Note: The Link Activity is not used in this exercise.

Random Database Access - Phase II

1. After successfully testing the function as defined, make necessary changes required to inquire against the data base randomly.
2. Assume the operator enters the data base key fields of company number and employee number.
3. The company number and employee number for testing your transaction are as follows:

COMPANY:	1	
EMPLOYEE NUMBERS:	1111	TIBERIUS CAESAR
	12346	CAESAR CLAUDIUS
	878	(not on file)
	1010101010	BO DEREK

4. Test the inquiry function using the following steps:
 1. Clear screen.
 2. Enter transaction code ZxxP, where xx is your group number.
 3. After your map is displayed, enter a company number and employee number from the above list, and press the ENTER key. Note the result code. If successful, the exact employee requested should be displayed.
 4. Continue with the remaining test cases.

Note: Data Group Result will contain the value of 7 on a NOT FOUND and the value of 1 on END DATA.

Notes:

Summary

Summary

- High volume online transactions can be run as a pair of CICS or IMS transactions (prompt,work)
- Begin with the Process Dictionary transaction definition to trace flow
- Identify the work activities from the transaction definition
- Trace flow of activities to walk through the work flow and identify entries
- Umbrella screens provide flexibility via internal cross-reference facilities

© 2001 CSC. All rights reserved

19

- The Umbrella Example System (UES) contains models of the use of all Umbrella subsystems.
- Under Hogan, high volume online transactions can be efficiently run as a pair of CICS or IMS transactions (a prompt and a work transaction).
- To trace work flow under Hogan both in batch and online environments, begin with the Process Dictionary transaction definition.
- From the transaction definition, you can identify the activities that make up the work.
- By tracing the flow of activities, you can walk through the work flow and identify the other Process Dictionary entries invoked, such as, maps, programs, data bases, data groups, data fields.
- The Umbrella screens are designed to provide flexibility in accessing the various and numerous screens housing the Process Dictionary parameters.

Executing a Program Online

19

Purpose

To invoke a program
online you must
issue a Link Activity

© 2000 CSC. All rights reserved

Notes:

Objectives

The slide features a light purple background with a faint white cloud graphic. In the top left corner is the red CSC logo. To the right of the logo is the word "Objective" in large, bold, yellow 3D letters. In the top right corner is a red, white, and blue target icon with three yellow arrows hitting the bullseye. Below the title, centered on the slide, is the text "To be able to invoke your program online". At the bottom left of the slide is a small copyright notice: "© 2000 CSC. All rights reserved".

Invoking a Program Online

Invoking a program under the Umbrella in an online environment is no different from invoking a program in batch. The link activity is used. The COBOL program we have been coding has only executed in the batch environment, SO FAR. In the JCL SYSIN you provided PEM with the information needed to locate the Transaction Definition in the Process Dictionary. Your batch Transaction Definition specified a link activity to your COBOL program.

In the WORK Transaction Definition, coded in the last exercise, we did not execute any link activities. Our online transaction displayed our map for both sequential and random accesses to the EMP Data Base.

Notes:

Problem Specifications—Execute Program Online

Link to Application Program - Phase I

- Change the WORK Transaction to execute Link activity 9994xx, where xx is your group number, instead of HDB activity 9996yy, where yy is your group number + 20. Your activities should now be WA, DC, LK, and DC.
- From a cleared screen, key the PROMPT ZxxP, where xx is your group number, Transaction Code and press ENTER. The Prompt Transaction caused your map to be displayed just as it did in the last lab exercise.
- Now press the ENTER key again. This will cause the ZxxW, where xx is your group number, to be executed. However, this time the work transaction contains the link activity to your program. It is your program that is reading the EMP Data Base.
- Data group result contains the value of 7 on a NOT FOUND and the value of 1 on END DATA.

Notes:

Umbrella Programming

Problem Specifications—Execute Program Online

Enhance Map/Random Access - Phase II

Not only does your COBOL program read the EMP Data Base it also links to Date Services and CDMF. With all of that extra information accessible it would be nice to display some additional information on our map.

FROM DATA GROUP	DDID	COBOL NAME
10 BUSINESS DAYS FROM TODAY	2000	THE48006 DCB-RAW-DATE-AREA
JOB CLASS	47120	TQE47206 JOB-STAT-CLASS
JOB POSITION CODE	47120	TQE47207 JOB-STAT-POSITION
POSITION DESCRIPTION	47190	TQE47902 EMP-POS-DESCRIPTION

1. Modify your screen layout. Follow all steps required when a map is changed.
2. In the real world an online inquiry would access the data base randomly. To make our exercise more like the real world, keep the sequential access for batch processing but for the online processing access the data base randomly. Follow all steps required when a program is changed.
 - Change the BA000-MAIN-LINE section to test if the program is executing in batch or online by checking the TCB-SOURCE field. This field, TCB-BTCH, is located in the UTCB.

```
IF TCB-BTCH
    PERFORM RD000-READ-EMP-DB-SEQUENTIAL THRU RD099-EXIT
ELSE
    PERFORM RD100-READ-EMP-DB-RANDOM THRU RD199-EXIT.
```

- Add code in the RD100-READ-EMP-DB-RANDOM paragraph to issue HDB activity 9996yy, where yy is your group number plus 20, to access the EMP Data Base randomly. This activity was created in a prior exercise.
- Test for the following three conditions after accessing the data base.

Successful, exit

Not found, exit

Any other error, abend

Summary

Summary

- Several steps are required to change a screen
- Programs are invoked from a transaction by a link activity
- Data groups referenced by a map must be allocated prior to a data communication deblock activity

FPS Features

FPS is our online conversation manager software. It enables the processing of the features listed here.

The slide features a yellow-to-orange gradient background. In the top left corner is the CSC logo. The title "FPS Features" is prominently displayed in large blue letters. Below the title is a bulleted list of nine features. At the bottom left is a small copyright notice.

CSC

FPS Features

- Conversation manager
- Flexible processing of screens
- Saving of status between screens
- Communication between applications
- Establishment of processing levels
- Up to 10 simultaneous conversations
- Refresh of last screen displayed
- Security processing
- Function key support
- HELP screen processing

Notes:

Basics of FPS

FPS Environment Flow

Notes:

Application Control

Application systems that do online processing through the Function Processing System (FPS) control the screen flow and sequencing for the operator. The processing is driven by the business function, not a set of transaction codes.

Two important concepts to understand about FPS are conversation layer and processing level. A conversation is the utilization of FPS to perform a business task within an application. For example, Hogan's Customer Information System (CIS) is an FPS application. If a teller needs to make a name change for a customer, an FPS conversation is initiated. The teller could then be asked to locate account information for another customer. The teller could start up a second conversation within the CIS application. FPS allows an operator 10 simultaneous conversations per terminal and application.

Within a conversation layer, there can be multiple processing levels. A change in processing level can be needed to walk through the steps to accomplish a task. Most importantly, there is usually a need to save data from one step to the next. Changes in processing levels signal FPS to save data. When a customer name change is needed, other screens that contain the name (such as the account information screen) are presented to the operator for updating. These processing levels are set up for the operator by the design of the screen flow (scenario).

Notes:

Umbrella Programming

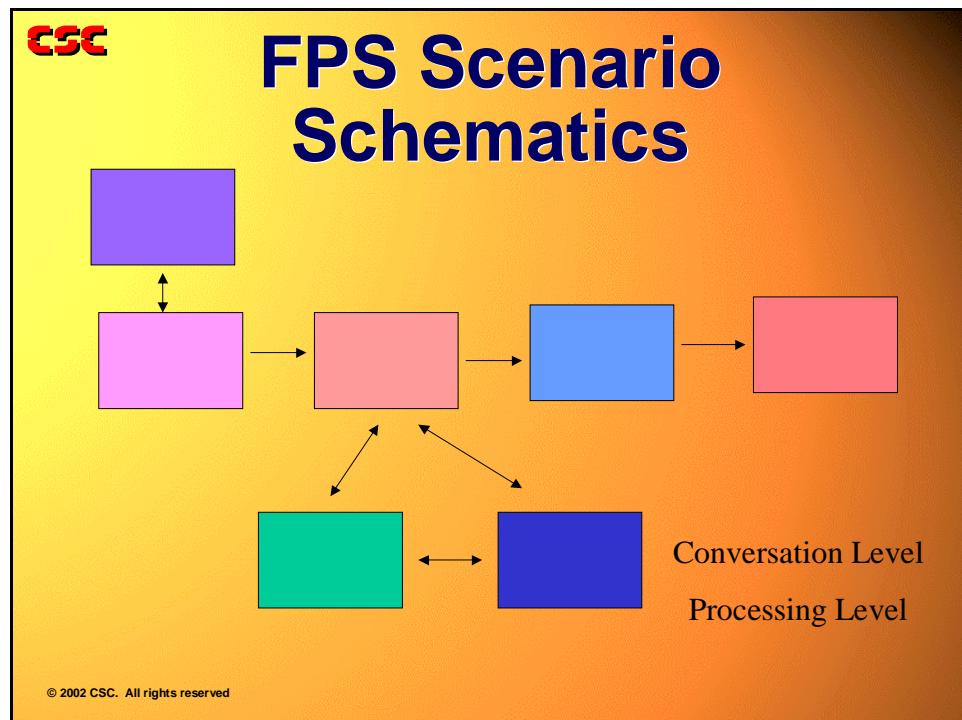

Basics of FPS

FPS Scenario Schematics

FPS is a driver module that uses CDMF formats (PCDs) and COBOL programs for online processing. Every screen is associated with a FPS Control record.

The following schematic illustrates a means of diagramming FPS scenarios. Each box represents a screen or FPS Control record. You will note that conversations may flow down or across. Downward flow indicates a change in processing level.

Because scenarios can be quite complicated, the use of such diagrams is strongly recommended.

Notes:

Information Needed by FPS

There are four pieces of information that have to be available. They are:

1. The screen to display
2. The program to process the screen
3. The screen that appears next
4. The data resources to save before displaying the next screen.

Data is saved across screens by FPS. It uses a file, the Conversational Terminal File (CTF) to save the data. The remaining information is provided to FPS on CDMF. FPS Conversational Control records are used to process the flow of screens (scenarios).

FPS Application Definition Requirements

To define an application to FPS, there are four requirements.

1. Each application must have at least three transactions. These are:
 - Prompt
 - Work
 - Reset

For example, these transactions for the DEM system are DEMO, DEMT, and DEMR, respectively.

2. The application must be defined in the Application Table.
3. There must be a FPS Control record for the main menu.
4. There must be a FPS operator/password entry to access the application.

Notes:

Umbrella Programming

Basics of FPS

Application Programs Running Under FPS

FPS links to COBOL programs to perform the business logic associated with the application. There are several requirements for COBOL programs running under FPS.

- They must interrogate the FPS command field to check the operator request.
- They cannot issue data communication activities.
- They must set a condition code for each possible outcome.
- They must return control to PEM.

Application Maps Running Under FPS

- The maps must contain the FPS header include maps.

Notes:

FPS Maintenance Screens

As with all Umbrella systems, FPS processing is controlled by parameters stored on CDMF and maintainable on-line through the Umbrella Maintenance Facility. The on-line maintenance facility consists of five components:

CSC

FPS Maintenance Screens

- Establishing an application
- Menu Control
- Establishing conversation or function
- Maintenance of operator security
- CDMF Help Processing

© 2002 CSC. All rights reserved

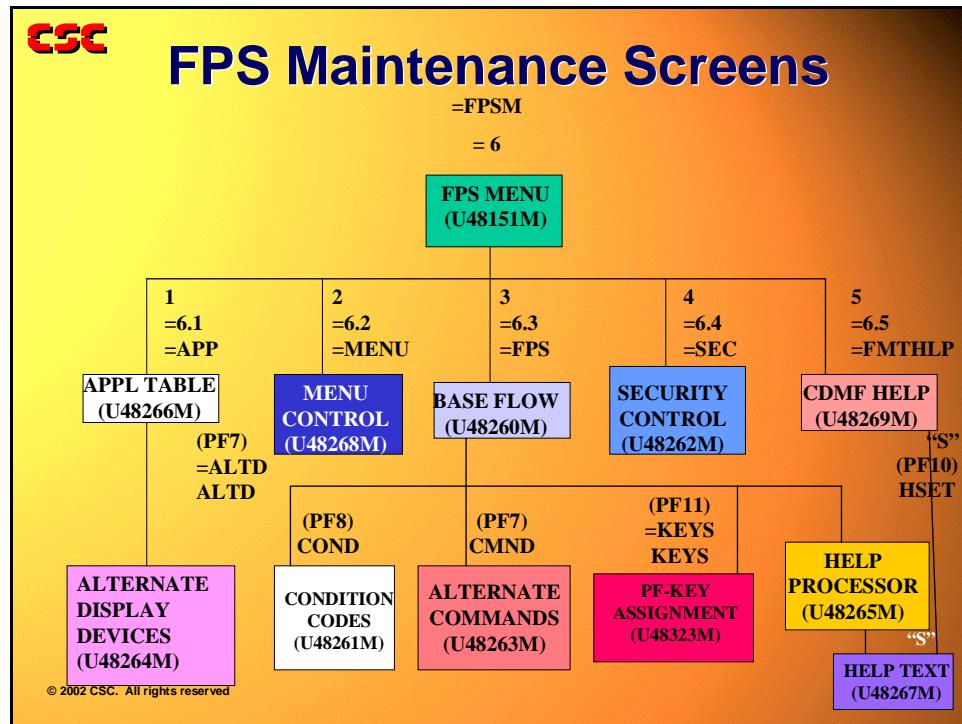

The following chart outlines the components of the conversation for FPS maintenance. Each box represents an on-line screen. Prompts from that screen are shown on the line leading to the box. Program function (PF) keys are shown in parenthesis. Unless otherwise indicated, all prompts are entered in the command field for the screen. Exceptions, such as prompts which must be entered on a specific line, are shown within double quotes. Any command which is preceded by an equal sign can also be entered from a cleared screen using the U transaction. Otherwise, the screen can only be accessed from its parent.

This class will limit its discussions to the first three (3) screens, Application Definition, Menu Control, and Conversation Control.

Umbrella Programming

FPS Maintenance Screens

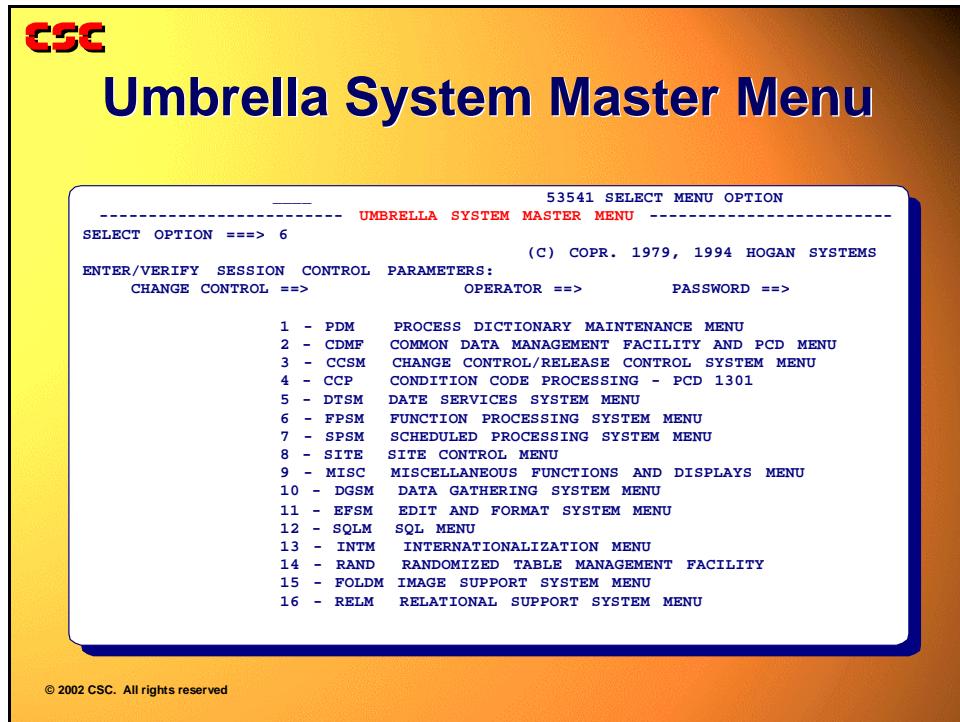

Notes:

Umbrella Programming

FPS Maintenance Screens

These options can be accessed through the Umbrella System Master Menu.

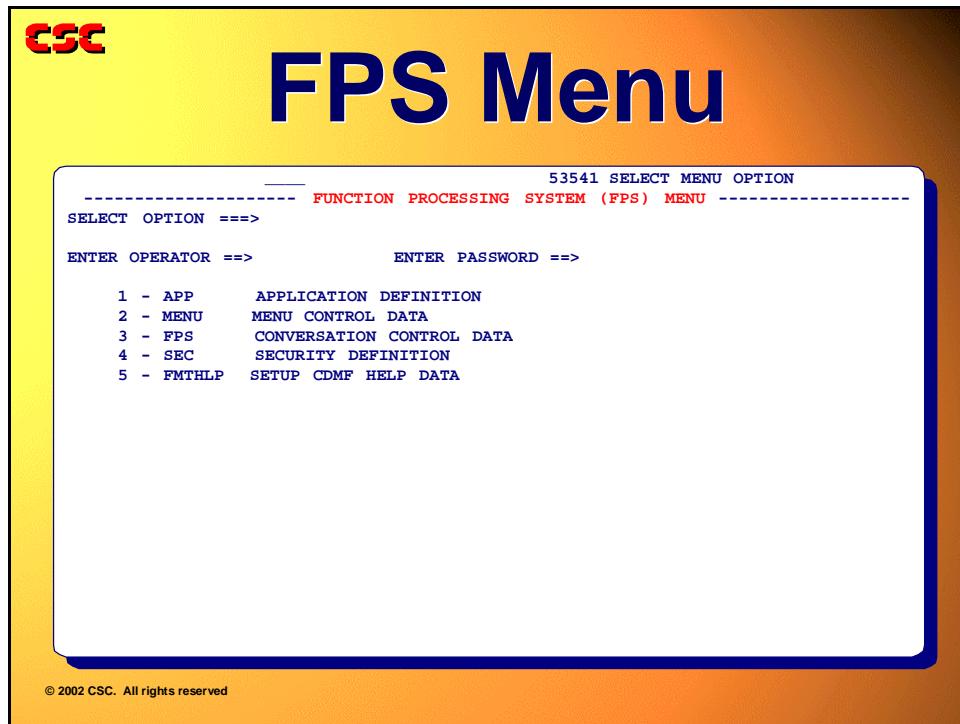

Key 6 or FFSM in the SELECT OPTION field and press ENTER to display the "Function Processing System (FPS) Menu" screen.

Notes:

Umbrella Programming

FPS Maintenance Screens

The direct prompts for these five functions are:

1. APP
2. MENU
3. FPS
4. SEC
5. FMTHLP

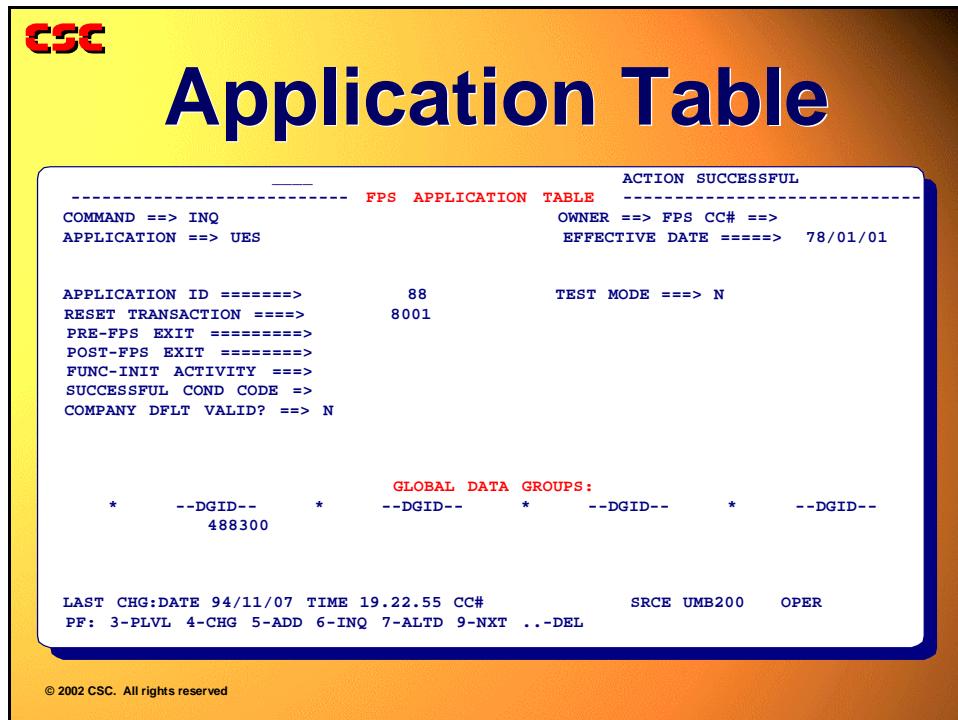

Notes:

Application Table Screen

The Application ID is used by the FPS Supervisor in determining the transaction to be processed. Any activities common to the application, rather than the conversation, are to be set-up on the "Application Definition" Screen.

The "Application Definition" Screen looks like this:

The "Application Definition" Screen can be displayed using one of the following techniques:

1. From the Function Processing System Menu, enter 1 in the SELECT OPTION field and press ENTER.
2. From the UMBRELLA System Master Menu, enter 6.1 in the SELECT OPTION field and press ENTER.
3. From any UMBRELLA System screen, enter =APP.xxx in the SELECT OPTION field and press ENTER.
4. From a cleared screen key in:

U APP.xxx

Where xxx is the application keyword. If a value for xxx is not entered, the first APP component on file is displayed.

Umbrella Programming

FPS Maintenance Screens

Menu Processor Control Data Screen

The starting point of all on-line systems is the main menu. Each application which runs under the FPS system must have a MENU function defined on the Conversation Control record. The key must be in the following format:

xxxMENU000 - where xxx = application code

The FPS Supervisor automatically builds this key when a PROMPT or a RESET transaction is entered. This entry is responsible for DISPLAYING and DEBLOCKING the master menu for the application xxx.

Although there is more than one way to process the menu, the most straightforward method is through the use of the MENU PROCESSOR. Using this method, the Conversation Control entry with a function of MENU must have a LINK activity of 13563 for program I53563, the Menu Processor program. There must also be a Menu entry (PCD 1686) with the same user key as the Conversation Control entry, xxxMENU000. The Menu entry contains a list of prompt values and the associated user key of the Conversation Control record to begin a specific function.

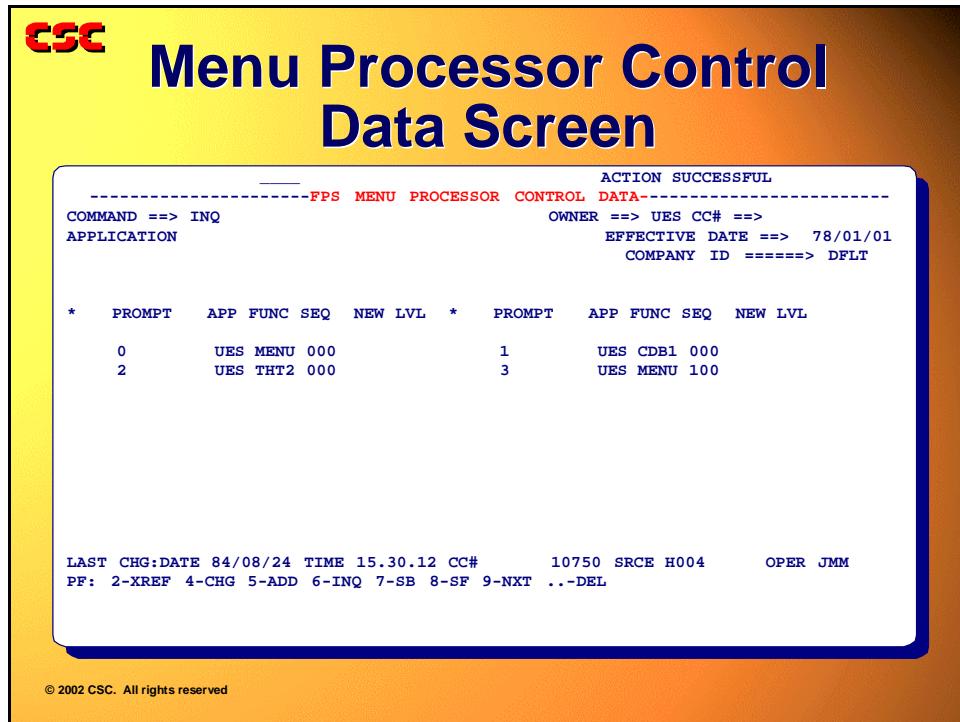

When FPS invokes the Menu Processor program, the Menu entry is retrieved and the list of prompt values is interrogated to determine the correct Conversation Control record needed to begin the execution of the function requested.

FPS expects menu prompts to be placed in the next command field or the FPS action field. In addition, any command with an = (equal sign) in position one invokes the menu processor to determine the correct Conversation Control entry to execute.

Notes:

The Menu Processing Maintenance screen looks like this:

The Menu Processing Maintenance screen can be displayed using one of the following techniques:

1. From the Function Processing System Menu enter 2 in the SELECT OPTION field and press ENTER.
2. From the UMBRELLA System Master Menu, enter 6.2 in the SELECT OPTION field and press ENTER.
3. From any UMBRELLA System screen, enter =MENU.xyyyzzzz in the SELECT OPTION field and press ENTER.
4. From a cleared screen key in:

U MENU.xyyyzzzz

Where xxx is the application mnemonic.

yyyy is the function desired.

sss is the sequence number of the menu.

If a value for xxxyyysss is not entered, the first MENU component on file is displayed.

Umbrella Programming

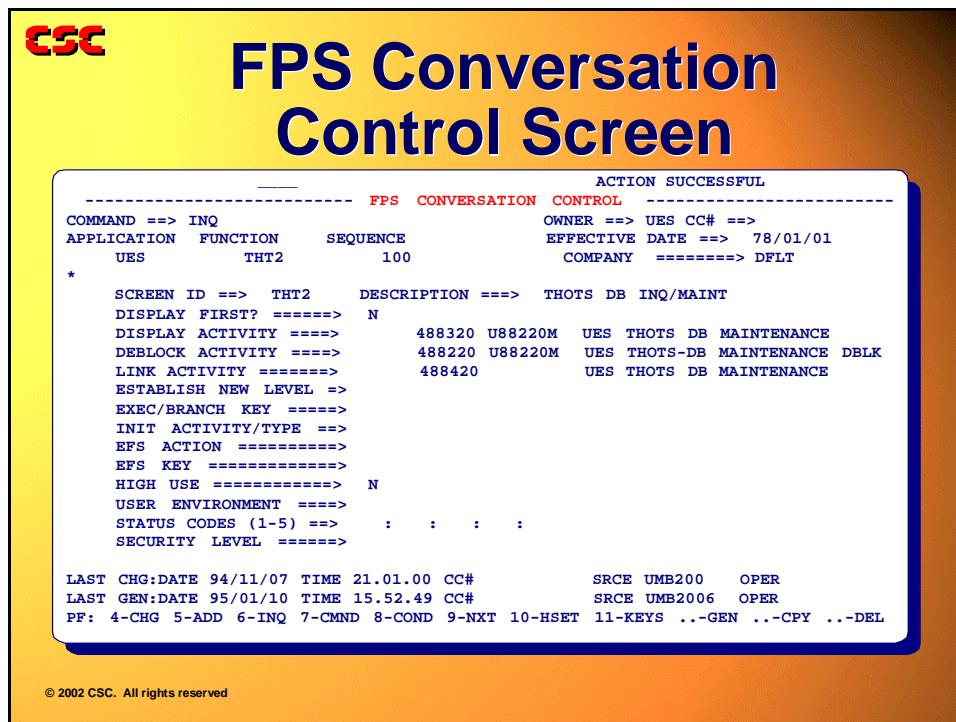

FPS Maintenance Screens

Conversation Control Screen

The flow of logic executed by FPS is maintained on this screen. FPS determines the correct Conversation Control entry from the Menu Processor. This entry is then retrieved and interrogated for Displaying and Deblocking the correct maps, as well as, executing the Link activity of the correct program for massaging the data properly. This entry also directs FPS to the NEXT entry to be executed in the flow of the conversation.

Due to the amount of information contained on the Conversation Control record, the on-line maintenance is contained on two screens. The first contains the basic information and the second contains all the condition codes for that particular entry.

The FPS Basic Conversation Control screen looks like this:

There are two simple forms Conversation Control Entry. The first is called the Basic Logic Entry, or BL. The view in the example screen shows a typical BL entry. It is called a Basic Logic Entry because it contains Activity Numbers that cause external application logic processing to occur, and because it contains a Condition Code table which determines the continuing flow of the transaction logic.

The second type of entry is called a Branch Execute Entry, or BE. A BE unconditionally redirects the flow of an FPS transaction to another Conversation Control Entry. An example of this sub type appears later in this chapter.

The FPS Basic Conversation Control screen can be displayed using one of the following techniques:

Umbrella Programming

FPS Maintenance Screens

1. From the Function Processing System Menu enter 3 in the SELECT OPTION field and press ENTER.
2. From the UMBRELLA System Master Menu, enter 6.3 in the SELECT OPTION field and press ENTER.
3. From any UMBRELLA System screen, enter =FPS.xyyyssss in the SELECT OPTION field and press ENTER.
4. From a cleared screen key in:

U FPS .xxxxyyysss

Where xxx is the application mnemonic.

yyyy is the function (e.g., CONV).

sss is the sequence number desired (e.g., 000).

If a value for xxxxssss is not entered, the first FPS component on file is displayed.

Notes:

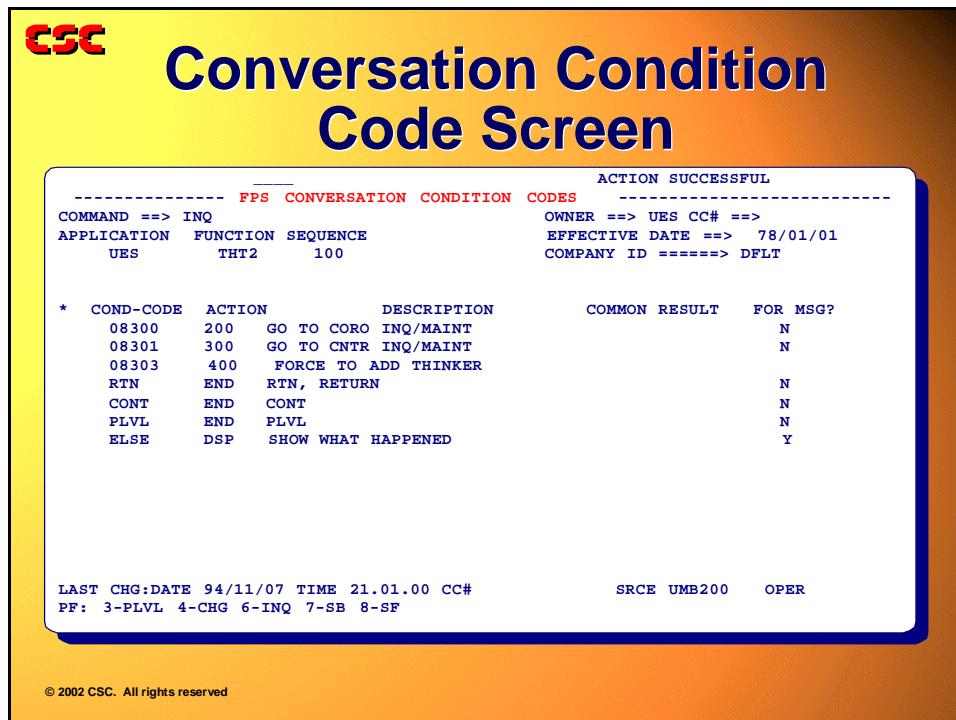

Umbrella Programming

FPS Maintenance Screens

Conversation Condition Code Screen

As can be seen on the previous logic flow chart, the condition codes contained on the Conversation Control entry are used by the FPS supervisor to determine the next step to be executed. FPS interrogates the list of condition codes contained on the Control entry against TCB-USER-CC to determine the ACTION to be taken. When the correct code is found the ACTION field is analyzed for the proper execution process.

The Conversation Condition Code screen looks like this:

The Condition Code screen may be displayed only from the basic conversation screen. This screen may be displayed using one of the following techniques:

1. From the Conversation Control Base Screen press PF8.
2. From the Conversation Control Base Screen, enter COND in the COMMAND field and press ENTER.

Notes:

FPS and CDMF

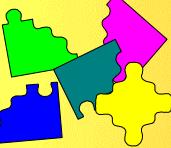

The values contained in the preceding screens are stored on CDMF as formats. The following table associates each screen with the format on which the screen data are stored.

SCREEN	FORMATID
Application Table Screen	48266
Additional Display Device Screen	1694
Menu Processor Control Data Screen	1686
Conversation Control Screen	1690
Conversation Condition Code Screen	1690
Alternate Command Screen	1693
Function Key Definition Screen	48323
Help Processor Screen	1688
Help Processor for CDMF Formats Screen	1688
Help Description Data Screen	1687
Operator Security Control Screen	1698

Notes:

Summary

Summary

- ✓ FPS Applications link to FPS Supervisor
- ✓ Processing of multiple screens with same set or transaction codes
- ✓ Application in control of processing of screens
- ✓ FPS gains information from Conversation Terminal File and FPS Control records
- ✓ Scenarios should be designed in detail through diagrams

© 2002 CSC. All rights reserved

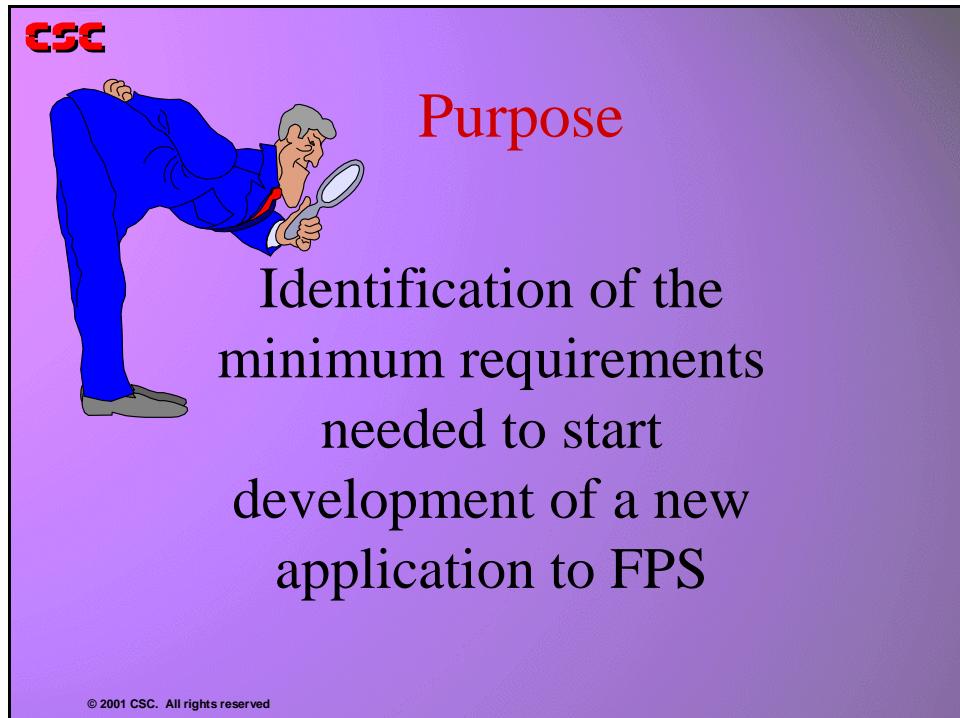

- All FPS Applications link to the FPS Supervisor, which performs the application's data communications needs and links to the application programs.
- The FPS System allows for the processing of more than one screen using the same set of transaction codes.
- FPS is designed for the application to be in control of the processing of screens. It provides a user-friendly system where an operator is guided through a business function, such as setup of a new customer.
- Online systems need to know the screen to display, the program to process the screen, the next screen, and the data to save before displaying the next screen. FPS gains this information from the Conversational Terminal File and FPS Control records.
- FPS scenarios should be designed in detail through diagrams.

Objectives

CSC

Objectives

To become familiar with:

- Transactions needed for an FPS application
- Fields needed in an Application Definition
- Control entry needed by an application
- Application addition to a security control screen
- Map modification for an FPS application
- Application program modification for communication

© 2001 CSC. All rights reserved

FPS Requirements

The four requirements for an application system to process under the FPS system are listed below:

CSC

FPS Requirements

- Three transaction definitions on the Process Dictionary
- An application definition entry for the application
- An FPS control entry defining the menu for the application
- An FPS security definition entry authorizing an operator/password combination to access the application

© 2001 CSC. All rights reserved

Notes:

Umbrella Programming

FPS Requirements

Transaction Definitions

Three transaction definitions must exist for an application which runs under the FPS system. The three transactions which are required must perform the following functions:

PROMPT	Display the menu screen or the last screen used.
WORK	Process the requested application function.
RESET	Re-initialize the CTF file for the current operator and display the menu.

Below are listed the three transaction codes for some applications running under FPS:

APPL ID	PROMPT RESUME	WORK	PROMPT RESET
CIS	HCIS	HCIT	HCIR
RPM	RPMP	RPMT	RPMR
TCS	TCS	TCST	TCSC
ILP	ILP	ILPT	ILPC
OTP	OTP	OTPL	OTPR
CDS	KD00	KD01	KDRS
IDS	IDSP	IDST	IDS R
UMB	UMB	UMBT	UMBR
DEM	DEMO	DEMT	DEMR
UES	UES	UEST	UESR

Notes:

Application Table Entry

Each application which runs under FPS must have an application table entry on CDMF. The application table defines the characteristics of the FPS application, including the Application ID of the application's transactions, a three-character application code which uniquely identifies the application, and the condition code set by the application programs to indicate the successful execution of the operator's request.

Notes:

Umbrella Programming

FPS Requirements

Control Definition for Main Menu

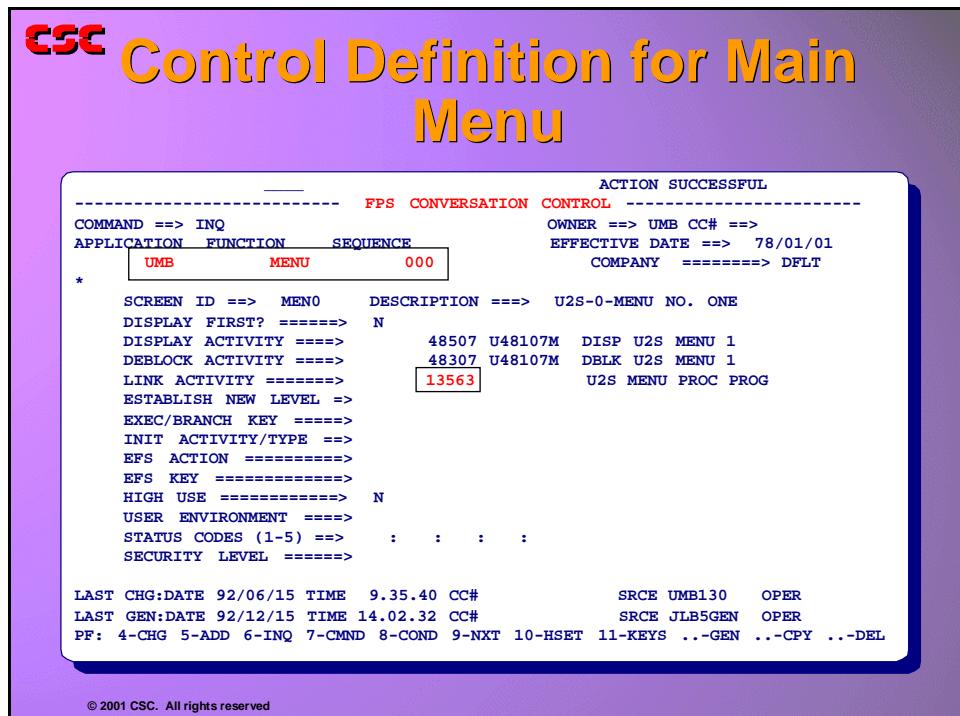

Each application executing under the FPS system must define a menu function (the first function) on an FPS Control entry. The item key for the MENU function must be in the following format:

AAAMENU000

where...

AAA = the alpha application code

The item key for the menu function must be in the above format because the FPS Supervisor program automatically builds the FPS control key for the menu function as seen above when an initial PROMPT or a RESET transaction is done.

Notes:

FPS Operator Security Control

Each application which runs under the FPS system must be referenced on at least one operator/password security record. The item key for the security record must be in the following format:

000OPPPP
where...
0000 = Operator ID
PPPP = password

The security record lists every application which the operator/password combination is allowed to access and indicates the level of security associated with each application.

One delivered security record has a blank item key, indicating an Operator ID of blank and a password of blank. This record is the most logical one for adding your new application.

Relationship of FPS to Application Programs

Notes:

Application Requirements

Introduction

There are four means by which communication can be established between the application program and FPS.

1. FPS Communication Data Group - DG 13589
2. Through extensive common usage of condition codes
3. Condition codes defined on PCD 1301
4. Conversational Terminal File, or CTF

Of these four means, the first two place requirements on the application system. CTF manipulation and maintenance is handled exclusively by FPS. The maintenance of condition codes on PCD 1301 is an application responsibility, but it is optional.

This section discusses the application's use of FPS header maps as a tool to house information in data group 13589. It also addresses the setting of condition codes within the application program to indicate the outcome of the program's processing.

FPS Header Maps

The FPS system communicates with the terminal operator through key fields of information such as requested function, processing level, Application ID, conversation number and company number. This key information is stored in core in the FPS Common Communication data group (data group 13589, copy book I53589D). This information is passed to the FPS system through the entry of the data in the FPS header lines on the application screens.

FPS uses the technique of "double deblocking" on all maps. The header lines for the application are deblocked by PEM as part of the transaction definition before the FPS supervisor is invoked. These header lines may appear different from application to application but must contain the same information.

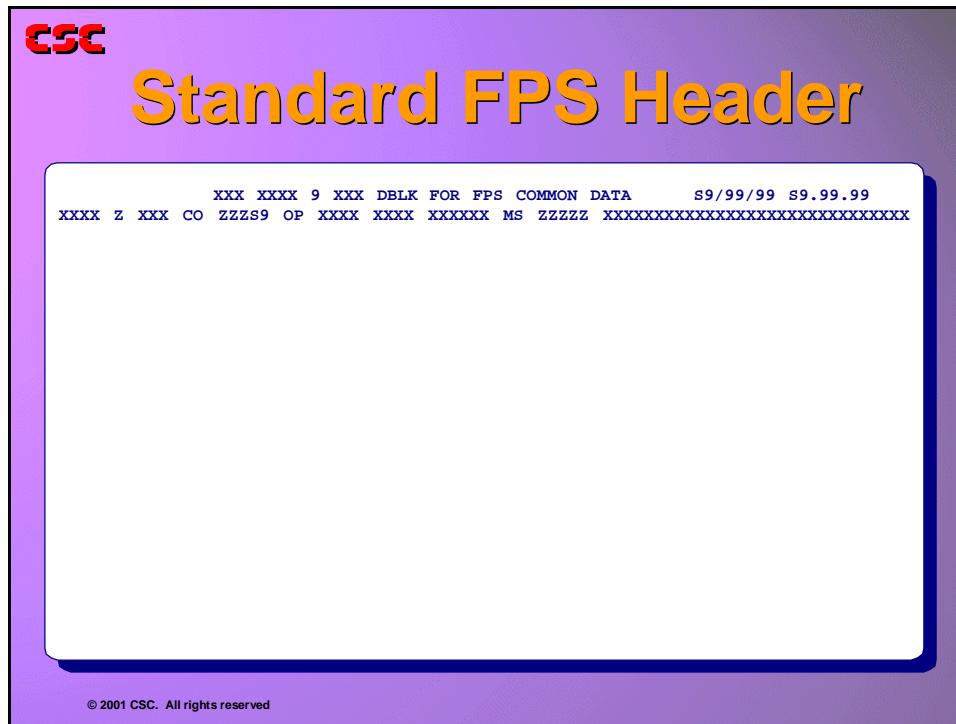

This key information is required for the FPS system to function and thus all applications screen maps must include one of the following:

1. The standard FPS header maps - I53589E and I53589F (APP# thru 99).
2. The standard FPS header maps - I53589E and I53589G (APP# over 99).
3. Maps which are user-designed and perform the same function as the standard FPS maps.

Notes:

I53589MA - Standard FPS Header

Used by several applications running under FPS.

Umbrella Programming

Application Requirements

Setting of Condition Codes

It was discussed earlier that the application systems communicate with FPS through the use of condition codes. The application programs check to see if special conditions exist and then set the appropriate condition code. The applications set the condition code in the TCB-USER-CC variable in the Transaction Control Block (TCB). The TCB is data group number 1 and is defined by copybook P49000D.

Following is an example of an application program setting the condition code for FPS.

Summary

Summary

© 2001 CSC. All rights reserved

22

- ✓ Application programs within FPS
 - ✓ Cannot issue data communication activities
 - ✓ Must set all needed condition codes
 - ✓ Must interrogate command field to determine last operator action
- ✓ Minimum requirements to set up FPS application
 - ✓ Prompt, work, reset must be defined
 - ✓ Application must be defined in FPS Application table
 - ✓ Must have an FPS Control record for a menu
 - ✓ Security entry for operator/password necessary
- ✓ Maps must have FPS header lines

- Application programs within FPS applications cannot issue data communication activities, must set all needed condition codes, and must interrogate the FPS command field to determine the last operator action.
- To set up a FPS application there are four minimum requirements:
 - At least three transactions (prompt, work, reset) must be defined
 - The application must be defined in the FPS Application Table
 - There must be a FPS Control record for a menu
 - There must be a security entry for operator/password.
- Maps used within FPS applications must have FPS header lines. These lines are generally provided through include maps.

Conversation Control Screen

The flow of logic executed by FPS is maintained on this screen. It is retrieved and interrogated for Displaying and Deblocking the correct maps, as well as executing the Link activity of the correct program for massaging the data properly. The entry also directs FPS to the next entry to be executed in the flow of the conversation.

Due to the amount of information contained on the Conversation Control record, the on-line maintenance is contained on two screens. The first contains the basic information and the second contains all the condition codes for that particular entry.

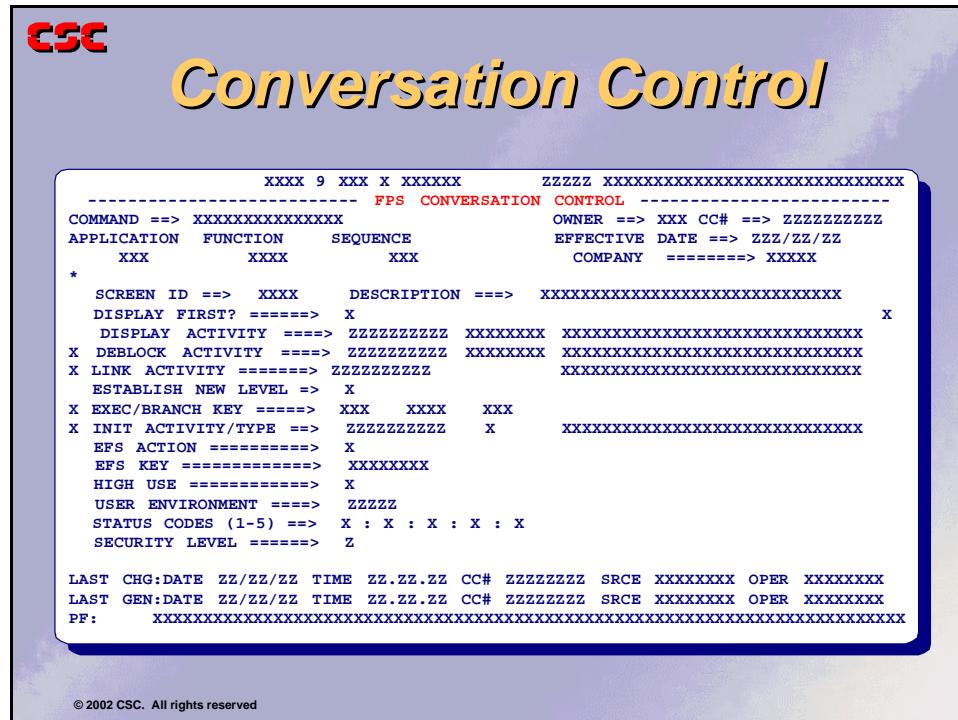

Notes:

Umbrella Programming

Conversation Control Screen

The FPS Basic Conversation Control screen looks like this:

The FPS Basic Conversation Control screen can be displayed using one of the following techniques:

1. From the Function Processing System Menu enter 3 in the SELECT OPTION field and press ENTER.
2. From the UMBRELLA System Master Menu, enter 6.3 in the SELECT OPTION field and press ENTER.
3. From any UMBRELLA System screen, enter =FPS.xyyyymmdd in the SELECT OPTION field and press ENTER.
4. From a cleared screen key in:

U FPS.xyyyymmdd

where xxx is the application mnemonic yyyy is the function (e.g., CONV) sss is the sequence number desired (e.g., 000).

If you do not enter a value for xxxyyys, the first Conversation record is presented.

Umbrella Programming

Conversation Control Screen

The fields on this screen are described as follows:

COMMAND

ADD (PF5)

Add a new conversation.

CHG (PF4)

Change the processing of a conversation.

CMND (PF7)

Invoke the screen to list the alternate commands that are valid in this conversation.

COND (PF8)

Invoke the screen to list the condition codes connected with this conversation.

CPY

Copy the basic information and all associated condition codes to another key.

DEL

Delete this conversation.

GEN

Create the generated version of this record that is to be used by the FPS Supervisor during execution of the conversation.

HSET (PF10)

Invoke the display of the Help processing control for the screen identified with this conversation.

INQ (PF6)

Display a requested conversation.

KEYS (PF11)

Invoke the display of the PF keys that are to be displayed when the DEBLOCK activity of this conversation is executed.

NXT (PF9)

Display the next conversation.

OWNER

The owner application identifier.

CC#

The change control number associated with any update function. The change control number must be compatible with the OWNER field.

EFFECTIVE DATE

The date this conversation is to effective to FPS.

Umbrella Programming

Conversation Control Screen

APPLICATION

The 3-byte mnemonic for the application.

FUNCTION

The user-defined function of this conversation.

SEQUENCE

The sequence number of the entry within the function.

COMPANY

The company number for which this conversation is valid. (The application record must have Y in the company default flag for this field to be a company number. Otherwise, it must be DFLT.)

* (action)

To view the ACTIVITY or go to the EXEC/BRANCH entry, enter:

S With a command of INQ, displays the activity or goes directly to the conversation defined by the EXEC/BRANCH entry.

SCREEN ID

Enter a user-defined code to be placed in the FPS common header when a display action is entered from this conversation. This is used as part of the key when requesting Help text during execution of the conversation.

DESCRIPTION

The purpose of this screen or entry.

DISPLAY FIRST?

Enter Y if the DISPLAY activity is to be issued the first time the entry is entered. If it is not, the LINK activity is issued and the DISPLAY activity is not issued unless a DSP is requested on an accompanying condition code entry. This field is only used if the display activity is nonzero.

If the function/sequence of the Control entry is equal to MENU000, the DISPLAY FIRST is treated as display.

DISPLAY ACTIVITY

The activity to be issued if DISPLAY FIRST equals Y or if the action of the resulting condition code is equal to DSP. This activity must be a previously-defined activity when updating the conversation. (The map name and description of the activity are displayed by the maintenance program when ENTER is pressed.)

If the EXEC/BRANCH KEY is present for this conversation entry, the DISPLAY ACTIVITY is never executed.

DEBLOCK ACTIVITY

The activity to be issued when ENTER is pressed during the execution of this

Umbrella Programming

Conversation Control Screen

conversation. This activity must be a previously-defined activity when updating the Conversation entry (the map name and description of the activity are displayed by the maintenance program when ENTER is pressed). If the EXEC/BRANCH KEY is present for this Conversation entry, the DEBLOCK ACTIVITY is never executed.

LINK ACTIVITY

Enter a valid program link activity to be issued. This is a required field, unless the EXEC/BRANCH field is entered. These are mutually exclusive, with the exception of an EXEC/BRANCH to a non-FPS application. In this case the link activity must contain a valid program link, and the EXEC/BRANCH must contain FPSEXIT000, designating an exit from FPS to the appropriate LINK ACTIVITY (the description of the activity is displayed by the maintenance program when ENTER is pressed).

ESTABLISH NEW LEVEL

This field is used only in conjunction with the EXEC/BRANCH field. Y indicates a new level of processing is to be established. The default is N.

EXEC/BRANCH KEY

The key of the FPS Control entry to be processed.

If the EXEC/BRANCH KEY is present, the display, deblock, and link activities for this Conversation entry are ignored.

If the ESTABLISH NEW LEVEL flag is Y, this key is considered to be an EXEC and the current processing is saved in order to return at the completion of the execution. The condition codes on this Conversation entry are then checked for determining the next step in the conversation.

If the NEW LEVEL flag is N or space, this entry is considered a BRANCH and does not return, thereby ignoring all condition codes on this Conversation entry.

INIT ACTIVITY/TYPE

The activity to be used for initialization based on the value entered in the TYPE field. The type code determines when the INIT activity is to be issued. The following values are possible:

- L** Issue the INIT activity every time just before the link activity is issued.
- I** Issue the INIT activity the first time this entry is read, but not upon returning from a display of this entry. (A return from another entry causes the INIT activity to be issued again, however.)
- E** Issue the INIT activity at the end of this entry before proceeding to another entry.

Umbrella Programming

Conversation Control Screen

EFS Activity

This activity must be a previously-defined activity when updating the conversation. (The description of the activity is displayed by the maintenance program when ENTER is pressed.)

EFS ACTION

The TYPE of action being requested from the Edit and Format System (EFS). This is used in conjunction with the EFS KEY also being passed. The values are:

- 1 Edit only.
- 2 Edit and format.

EFS KEY

The key used by EFS when an EFS edit is requested by the application program. The program associated with the LINK activity must have a link to activity 13555 (which is program I53555) for execution of the EFS edit.

HIGH USE

This field is not currently used.

USER ENVIRONMENT

This code is placed into TCB-USER-ENVMT just before the link activity is issued. It can be checked by the application program as a parameter to allow variations in processing based on the entry being processed. If a value of 65000 is coded in this field, the value of TCB-USER-ENVMT during the processing of the previous entry is not overlaid.

STATUS CODES

This field can be used to qualify execution of the entry. Any values that are present are compared to the corresponding values present in W-FPS-COMM-STAT in the FPS communications data group I53589D. If the compared fields are unequal, the current entry is not executed. FPS then reads the next entry for processing.

(STATUS CODE 5 is reserved by FPS for the current terminal status. This field is set to T if the terminal is in a TEST status; otherwise, it is set to P for Production. The application program can use this status indicator to qualify execution of entries under test or production modes.)

SECURITY LEVEL

This field contains a value of zero to 9. If the value is zero, operators can always execute this entry regardless of the security information present on their password record. If the field is greater than zero, the security password record of the operator must contain Y in the corresponding FUNC SEC position in order to execute this entry.

Conversation Condition Code Screen

The condition codes contained on the Conversation Control entry are used by the FPS supervisor to determine the next step to be executed. FPS interrogates the list of condition codes contained on the FPS Control entry against TCB-USER-CC to determine the action to be taken. When the correct code is found, the ACTION field is analyzed for the proper execution process.

Certain condition codes are represented on this screen by an alphabetic mnemonic rather than their number. These condition codes have special meaning to FPS. The condition code 65000 falls into this category. It is represented by the alphabetic mnemonic ELSE and is the catch-all or default value. If the value in TCB-USER-CC cannot be found in the list of condition codes, the action listed with ELSE is executed. This must be the last condition code in the list, since the FPS supervisor quits interrogation upon finding this condition code.

Other alphabetic mnemonics for condition codes include CONT, RTN, PLVL, EXIT, and HELP. These codes and their actions will be discussed in a later section. On an ADD to the base screen the CONT, RTN, PLVL, and ELSE condition codes are automatically created. The ELSE condition code is mandatory although the others may be deleted.

There are five categories of actions which can be associated with a condition code. They are listed below.

DSP	Issue the Display Activity.
END	End function processing at current level.
DYF	Execute a dynamic function.
ABE	Request to abend.
SSS	SSS represents a three-digit sequence value. Pass control to the FPS Control entry with the current application and function ID's, and the specified sequence number.

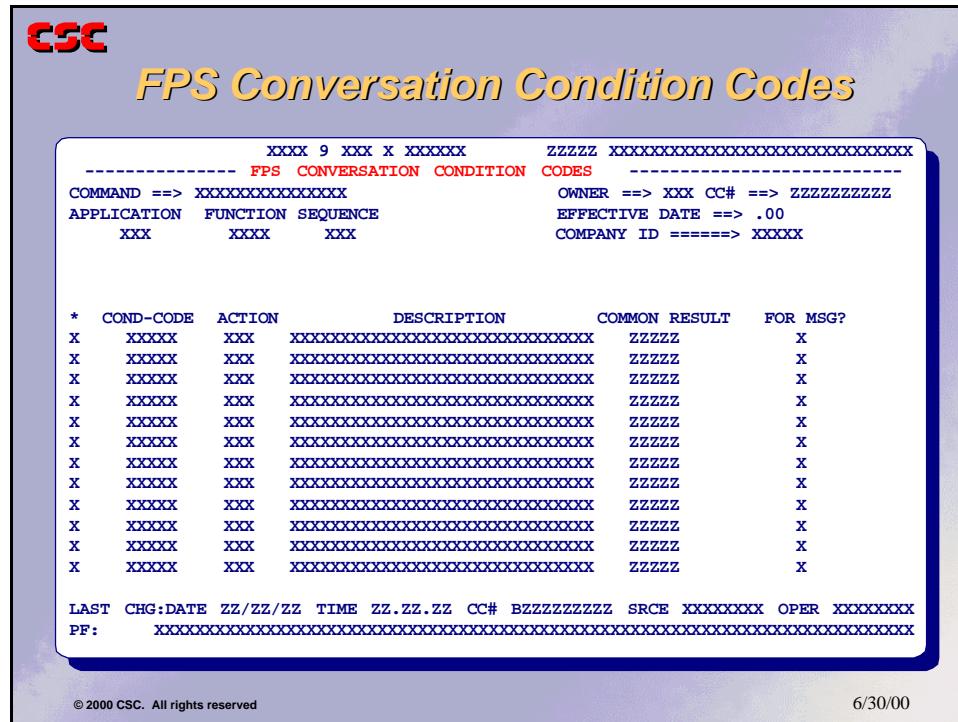

Notes:

Umbrella Programming

Conversation Control Screen

The Conversation Condition Code screen looks like this:

The Condition Code screen may be displayed only from the basic conversation screen. This screen may be displayed using one of the following techniques:

1. From the Conversation Control Base Screen press PF8.
2. From the Conversation Control Base Screen, enter COND in the COMMAND field and press ENTER.

The fields on this screen are described as follows:

COMMAND

CHG (PF4)

Change the condition codes of a conversation.

INQ (PF6)

Display the first 12 condition codes.

SB (PF7)

Display the previous 12 condition codes.

SF (PF8)

Display the next 12 condition codes.

OWNER

The owner application identifier.

CC#

The change control number associated with any update function. The change control number must be compatible with the OWNER field.

EFFECTIVE DATE

The date for which this conversation is to be effective to FPS.

APPLICATION

The 3-byte mnemonic for the application.

FUNCTION

The user-defined function of this conversation.

SEQUENCE

The sequence number of the entry within the function.

COMPANY ID

The company number for which this conversation is valid. (The application record must have Y in the company default flag for this field to be a company number. Otherwise, it must be DFLT.)

Note: OWNER, CC#, EFFECTIVE DATE, APPLICATION, FUNCTION, SEQUENCE, and COMPANY ID fields default to the corresponding fields on the "FPS Conversation Control" base screen.

*** (action)**

The action for this specific condition code. Valid values are:

A Add a condition code entry to the list.

C Change a condition code entry.

D Delete this condition code from the list.

COND-CODE

Enter a numeric condition code or one of the special FPS condition code mnemonics.

With an ADD to the base screen, the CONT, RTN, PLVL, and ELSE condition codes are automatically created. Any user-defined condition codes added by the operator are inserted just before the ELSE condition code.

RTN

Return to previous processing point.

CONT

Continue on.

PLVL

Return to previous processing level.

Umbrella Programming

Conversation Control Screen

HELP

Help screen processing requested. CC53553

EXIT

Go to Menu Processing. CC53545

ELSE

What to do if no other conditions are met. CC65000

If the value in TCB-USER-CC cannot be found in the list of condition codes, the action listed with 65000 is executed. This must be the last condition code in the list, because the FPS Supervisor quits interrogation upon finding this condition code.

ELSE cannot be deleted because it is required. However, if necessary, it can be changed to any other number and then that entry deleted.

ACTION

Enter one of the four FPS actions in the following list, or an alphanumeric sequence number of a Conversation Control entry.

DSP

Issue display activity.

The display activity coded on this entry is executed. If a display activity is not coded, the last screen is redisplayed and the current Control entry is overlaid with the entry belonging to the display activity.

END

End function processing at current level.

This action terminates the function at the current processing level. If the level is zero, the MENU function is initiated; otherwise, the level number is reduced by one and the processing status for the new level is restored. The condition code on the restored level then determines the action to be executed.

DYF

Execute a dynamic function.

This action builds the key for the Control entry from data in the FPS data group. APP is the value in W-FPS-COMM-APPL-CD, FUNCTION is the value in W-FPS-COMM-NEXT-CMND, and SEQ is the value in W-FPS-COMM-FUNC-BEGIN-SEQ. The application program must have placed the proper values in these fields.

ABE

Request to abend.

This action requests that FPS issue an abend. This is used for testing and for abnormal situations.

SSS

Sequence number of next entry to execute.

Using the APP and FUNC of the current entry, this sequence number is used to build the key of the next Conversation Control entry to execute.

DESCRIPTION

Enter a short description of what is executed when this condition code is the value of TCB-USER-CC. (This is for documentation only.)

COMMON RESULT

Enter a user-defined numeric value, or leave space. This field is moved into the W-FPS-COMM-RESULT field of data group 13589, and can be used by the application program for special processing. A value of 65000 in this field indicates the current value of TCB-USER-CC is to be placed in W-FPS-COMM-RESULT. A value of 65001 indicates that the current value of W-FPS-COMM-RESULT should be moved to TCB-USER-CC.

FOR MSG?

Enter N or Y. The default is Y. If the value is N, the condition and any message present are not saved for output on the displayed screen.

Notes:

Umbrella Programming

Methods of Communication Between Application Programs and FPS

Methods of Communication Between Application Programs and FPS

Three of the fields on the Conversation Control screen are used to communicate between FPS and application programs. A discussion of each of these fields and how it is used follows.

Status Qualifiers - Program to FPS

These fields will be set by an application program as it executes and then later be checked against values on the Conversation Control entry. The application programs set values in the corresponding fields in the variable W-FPS-COMM-STATUS in the FPS Common Data Group 13589. Those values are then checked against the values of the status qualifiers as set on the control entry. If the values in Data Group ID 13589 do not match all existing values on the entry, the entry is not executed and the next entry for the application is used for processing.

User Environment Code - FPS to Program

This field will be set by the control entry and then checked by the application program. This allows the application program to perform different actions based on which entry is being processed. The value of this field is moved into the TCB-USER-ENVMT variable before the link activity specified on the entry is issued.

As an example of usage, the CIS system uses the following values in TCB-USER-ENVMT to determine a) the type of access to be allowed, and b) if a function should allow the current customer (account) key to be:

NO SPEC PROCESSING	0
SETUP KEY CHG OK	1
" NO KEY CHG	2
MAINT KEY CHG OK	3
" NO KEY CHG	4
INQ KEY CHG OK	5
" NO KEY CHG	6

As another example of usage, the DPS system uses the following values in TCB-USER-ENVMT to determine the type of function to perform:

PRE/POST DISPLAY EXIT	10
REQUEST PROMPT	100
LINEUP PROMPT	200
REPRINT PROMPT	300

Common Result - Program to Program

This field allows programs to communicate with other programs and yet still have the processing flow defined by FPS control entries. The value in this field is moved into the W-FPS-COMM-RESULT field in the FPS Communication Data Group 13589 when a match is found on the condition code with which this value is associated. This field can be used for passing back result codes from lower processing levels or for checking by application programs which next obtain control.

If the value is 65000, FPS will move the current TCB-USER-CC to W-FPS-COMM-RESULT. A value of 65001 will cause the current value of W-FPS-COMM-RESULT to replace TCB-USER-CC before the action is taken.

Notes:

Umbrella Programming

Branching to a Non-FPS Application

Branching to a Non-FPS Application

If it is necessary to branch to a non-FPS application, both a LINK activity and EXEC/BRANCH are coded on the Control entry. The EXEC/BRANCH must be FPSEXIT000, which is a keyword to FPS and not an actual Control entry.

The ESTABLISH NEW LEVEL? field has a special meaning; if it is set or allowed to default to N, FPS will restart the current application at its MENU when prompted from non-FPS application. Coding Y in this field will cause FPS to restart at the current function and check the TCB-USER-CC set by the non-FPS application against the values coded on the function.

To re-enter an FPS application after the conversation has branched out of it, an interface program must change the field TCB-APPL-ID to the Application ID of the field to which a return is needed. Next, the program must allocate the FPS data groups, link to the FPS Supervisor Program, and end. When FPS retrieves the relevant CTF record for the conversation, it will recognize by a flag that the operator is returning from a prior conversation and will resume processing accordingly.

Notes:

Basic Logic

Basic Logic Fields

The next two screens are extracts of the Conversation Control entry showing only the fields required for basic logic. The fields highlighted here perform two very specialized functions:

1. processing screen data and/or
2. providing horizontal movement between Control entries.

In processing screen data the DISPLAY, DEBLOCK, and LINK activity fields play a major role. As we already know, the program to which FPS has linked has the requirement of setting a condition code. Once it has been done and the program terminates normally, the FPS Control module will gain control and compare the newly set value in TCB-USER-CC against the list of condition codes found on the FPS Conversation Condition Codes entry. Associated with each condition code is an action to be taken. This may entail branching to another FPS Control entry, displaying the screen, abending, or ending the current processing level. The branching action implies horizontal movement, i.e. the processing level is *not* increased when the branch takes place.

FPS Basic Logic Flow UMBR Transaction

1. The transaction starts when the operator keys in UMBR from a cleared screen.
2. PEM looks up the Transaction Definition on the Process Dictionary. It has an Application ID of 48 and a Function ID of 53.

Umbrella Programming

Summary

- The FPS Conversation Control screen maintains the information to display and deblock a map, and link to an application program, so as to interrogate the FPS command field to determine the last operator action.
- The FPS Conversation Control Condition Code screen contains a table which can determine where or what function is performed next.
- The following are known as the primary FPS Basic Logic fields:
 - 1.DISPLAY FIRST?
 - 2.DISPLAY ACTIVITY
 - 3.DEBLOCK ACTIVITY
 - 4.LINK ACTIVITY
- Several methods of communication are possible between FPS and the application program.
- Branching to a non-FPS application is possible by specifying the special FPS interface key of FPS/EXIT/000.

Overview

CSC

To Process the Menu

- * Use the FPS Menu Processor
- * 13563
- * Code the functions of new FPS Control entry userkeys on map
- * Enter desired function directly

© 2001 CSC. All rights reserved

The starting point with all on-line systems is the main menu. With all FPS on-line systems the reset transaction will cause the application main menu to be displayed. However, there is more than one way to process the menu. Some of the more common methods include the following:

- Using the delivered FPS Menu Processor Activity, 13563
- Coding the functions of new FPS Control entry userkeys on the map where they can be accessed by an application program.
- Entering the desired function directly into the FPS NEXT COMMAND field.

This section will discuss the most common method, the FPS Menu Processor.

Notes:

Umbrella Programming

The FPS Menu Processor

The FPS Menu Processor

The most straightforward method of menu processing uses the FPS Menu Processing entries stored on CDMF.

Each Menu Processing entry contains a list of prompt values. Each prompt value is associated with a userkey for an FPS Control entry. When a terminal operator selects a menu prompt, FPS transfers control to the entry whose userkey corresponds to the menu prompt just selected.

The mapped image below displays the fields of the FPS Menu Processor Control Data screen.

Field Definitions

© 2001 CSC. All rights reserved

Notes:

Umbrella Programming

The FPS Menu Processor

The fields on this screen are described as follows:

COMMAND

ADD (PF5)

Add a new menu control record.

CHG (PF4)

Change the prompt commands and/or the key of the conversation to be executed.

DEL

Delete this menu control record.

INQ (PF6)

Display a requested menu control record on file.

NXT (PF9)

Display the next menu control record on file.

SB (PF7)

Display the previous 22 prompt entries.

SF (PF8)

Display the next 22 prompt entries.

OWNER

The owner application identifier.

CC#

The change control number associated with any update function. The change control number must be compatible with the OWNER field.

EFFECTIVE DATE

The date that this menu control is to be effective.

APPLICATION

The 3-byte mnemonic for the application.

FUNCTION

The 4-character function of the menu entry.

SEQUENCE

The sequence number of the specific menu to be maintained.

COMPANY ID

The company number for which this menu control is valid. (The application record must have Y in the company default flag for this field to be a company number. Otherwise, it must be DFLT.)

Umbrella Programming

The FPS Menu Processor

* (action)

The action for this specific prompt. Valid values are:

A Add the prompt and key as specified by the PROMPT, APP, FUNC, and SEQ fields.

C Change the prompt and key as specified by the PROMPT, APP, FUNC, and SEQ fields.

D Delete the PROMPT command.

S With a command of INQ, display the Conversation Control entry with this key.

PROMPT

The value to start the conversation processing for the corresponding APP.FUNC.SEQ fields.

APP FUNC SEQ

The key of the Conversation Control entry that FPS is to execute for this prompt value.

NEW LVL

Enter Y if a new FPS level should be created (not currently supported).

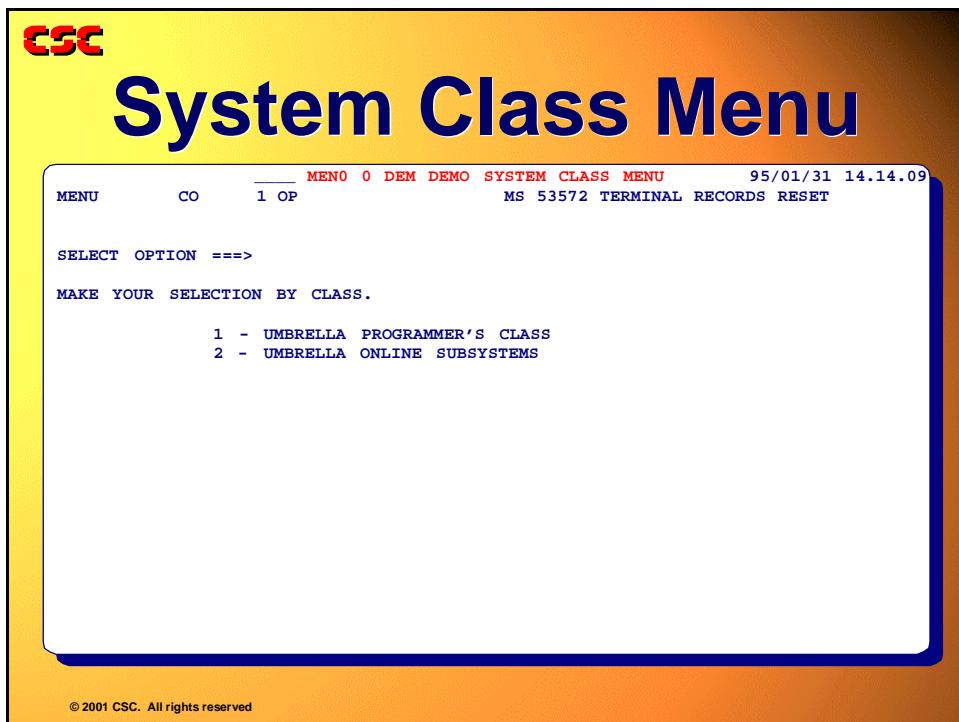

Notes:

Umbrella Programming

The FPS Menu Processor

Shown below is the SYSTEM CLASS MENU. This menu is used to drive the on-line exercises for the UMBRELLA classes. On the following page you will see the control and menu processing screens that direct its processing.

Notes:

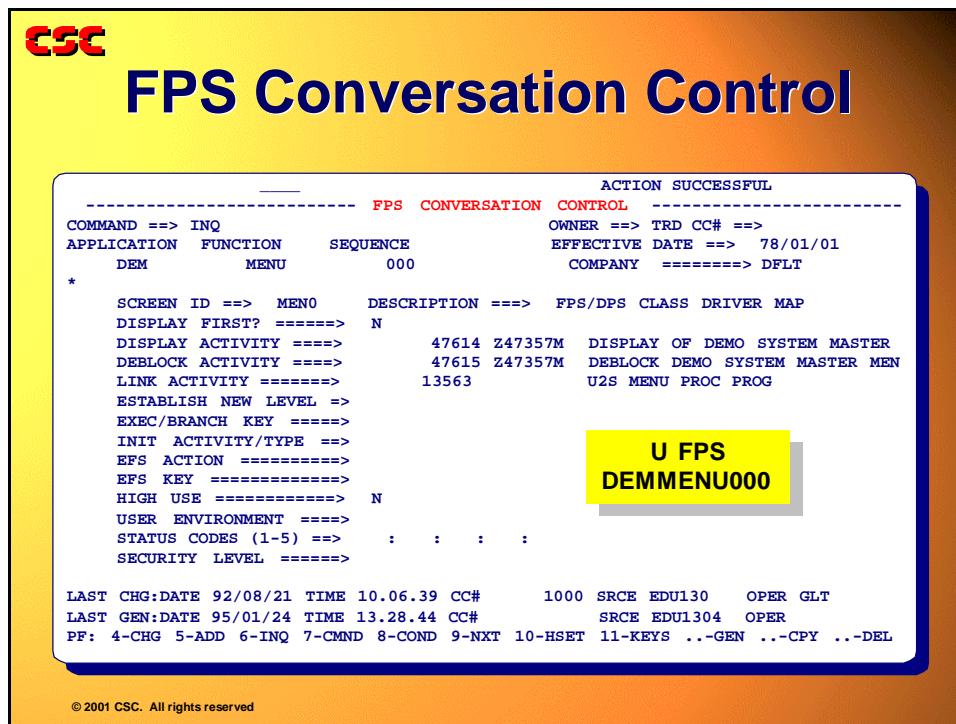

Umbrella Programming

The FPS Menu Processor

We already know that for application 'aaa' to run under FPS, a userkey of 'aaaMENU000' must be defined on the FPS Control entries. This entry is responsible for displaying and deblocking the master menu for the 'aaa' system. If this system is using FPS Menu Processing to process the menu, the following three requirements must also be met.

1. The Control entry must link to program I53563, the special Menu Processor program, using Activity 13563.
2. A Menu Processing entry must be defined with a key identical to the Control entry.
3. The Condition Code Control entry must include the condition code of 00000 with an action of DYF.

Umbrella Programming

The FPS Menu Processor

- Program 153563 uses the terminal operator entered option, and searches the FPS Menu Processor table of the entry with the same key as the Conversation Control record. When it finds a match, the App Func and Seq values are inserted in the FPS Communications DG 13589. The fields are W-FPS-COMM-APPL-CD, W-FPS-COMM-NEXT-CMND, and W-FPS-COMM-FUNC-BEGIN-SEQ respectively.
- 153563 sets condition code 00000 in TCB-USER-CC to indicate that the entered option was found. If the option is not found, condition code 53542 is set instead.
- 153563 ends, and control is returned to FPS. Following a link execution, the Condition Code table attached to the Conversation Control entry is searched.
- CC 0 is associated with the Action code of DYF. This action signals the FPS processor program that it is to look in DG 13589 to determine which Conversation Control record key is to be processed next.
- The next Conversation Control record is typically a BE, causing the CD Display Activity to be issued.

Purpose

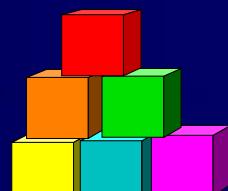

Notes:

Topics

Topics

- Branch logic
- Exec logic
- Walkthrough of exec logic
- End logic
- Walkthrough of end logic
- Combined exec and end logic

Objectives

Objectives

Explore:

- Fields needed to request branch or exec logic
- Difference between branch and exec logic
- Processing flow in conversation using exec logic
- Processing flow in conversation using end logic
- Control entries necessary to increase and decrease processing levels

Branch/Exec (Increase Level) Logic

Branch/Exec (increase Level) Logic

- Used to pass control from one application or function to another
- Transfer unconditional
- Contains no PEM activities
- Called tag points

Control is transferred from one FPS control entry to another by specifying a sequence number for the condition code action. Based on this request, FPS would build a new key with the same application ID, the same function ID, and the requested sequence number. While this technique is critical to being able to pass control from one entry to another, there are times in the construction of a scenario when we want to transfer control to a new function, or perhaps even to a completely new application. Branch and level control logic are used within an FPS conversation to pass control from one application and/or function to another. Below is an extract showing only the fields required for branch or exec processing.

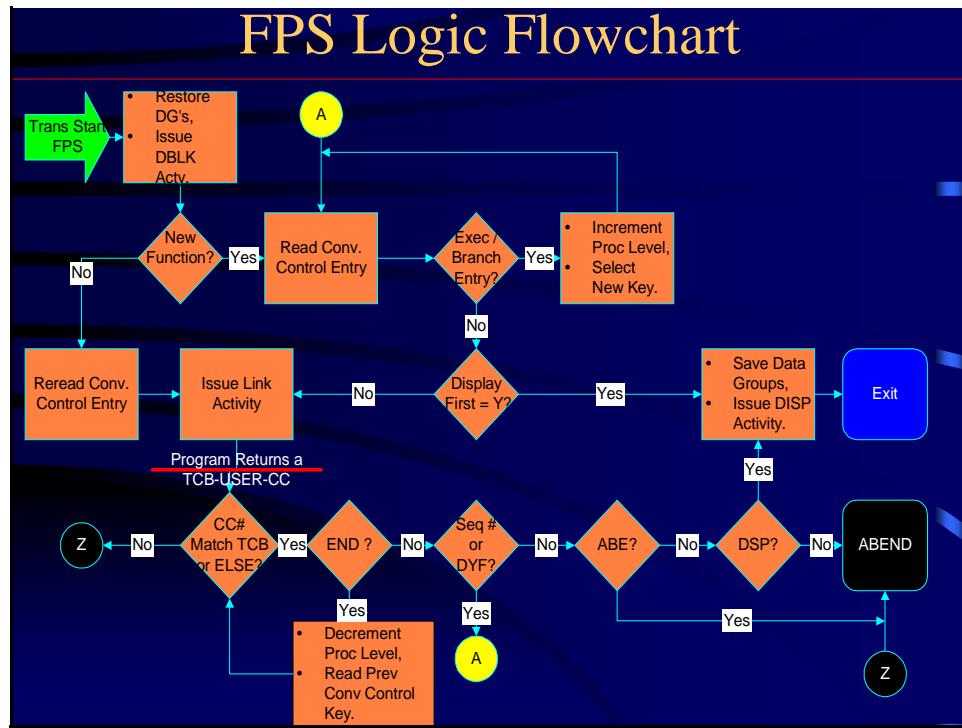

Notice that, unlike the transfer of control which occurs as the result of a condition code action, the transfer of control which occurs as the result of exec/branch logic is *unconditional* and occurs as soon as the entry is read. An entry with exec/branch logic is referred to as a 'Tag Point' entry. Notice that no PEM activities are coded on this type of entry. Additional fields that may be coded are: INIT ACTIVITY/TYPE and SECURITY LEVEL.

Umbrella Programming

Branch/Exec (Increase Level) Logic

FPS Logic Flowchart

Notes:

Necessary Fields

```

-----          ACTION SUCCESSFUL
--FPS CONVERSATION CONTROL-----
COMMAND ==> INQ           OWNER ==> CC# ==>
APPLICATION FUNCTION      SEQUENCE           EFFECTIVE DATE ==> 78/01/01
                   AAA     FFFF             SSS           COMPANY ======> DFLT
*
*   SCREEN ID ==> SSSS      DESCRIPTION ==> XXXXXXXXXXXXXXXXXXXXXXXXX
ESTABLISH NEW LEVEL ==>
EXEC/BRANCH KEY =====>

LAST CHG:DATE      TIME        CC#        SRCE        OPER
LAST GEN:DATE      TIME        CC#        SRCE        OPER
PF: 4-CHG 5-ADD 6-INQ 7-CMND 8-COND 9-NXT 10-HSET 11-KEYS ...-GEN ...-CPY ...-DEL

```

Additional fields that may be coded:

INIT ACTIVITY/TYPE
SECURITY LEVEL

If the NEW LEVEL field contains an 'N', then FPS will execute a branch, which involves the transfer of control to a new item without increasing the processing level of the conversation. In other words, we are causing horizontal (one-way) movement to occur. The following two control entries are examples which request branch processing. *No condition codes are required, since we will not be returning through this entry.*

Notes:

Umbrella Programming

```

Notes:

Coding 'Y' for NEW LEVEL causes exec processing to be performed. In exec processing, not only is a new FPS control entry specified for processing, but the processing level is increased as well. In essence this entry is nothing more than a vehicle for continuing on to another entry, while increasing the processing level. Unlike the horizontal branch we saw earlier, condition codes must be present on this type of entry. The following screens illustrate a tag point coded for exec processing.

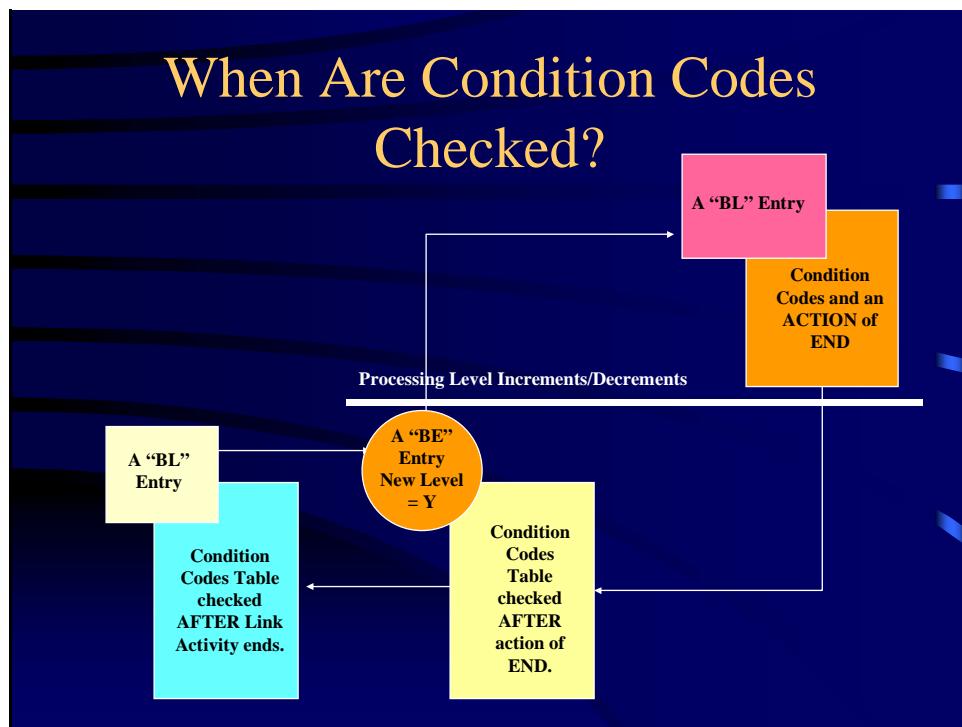

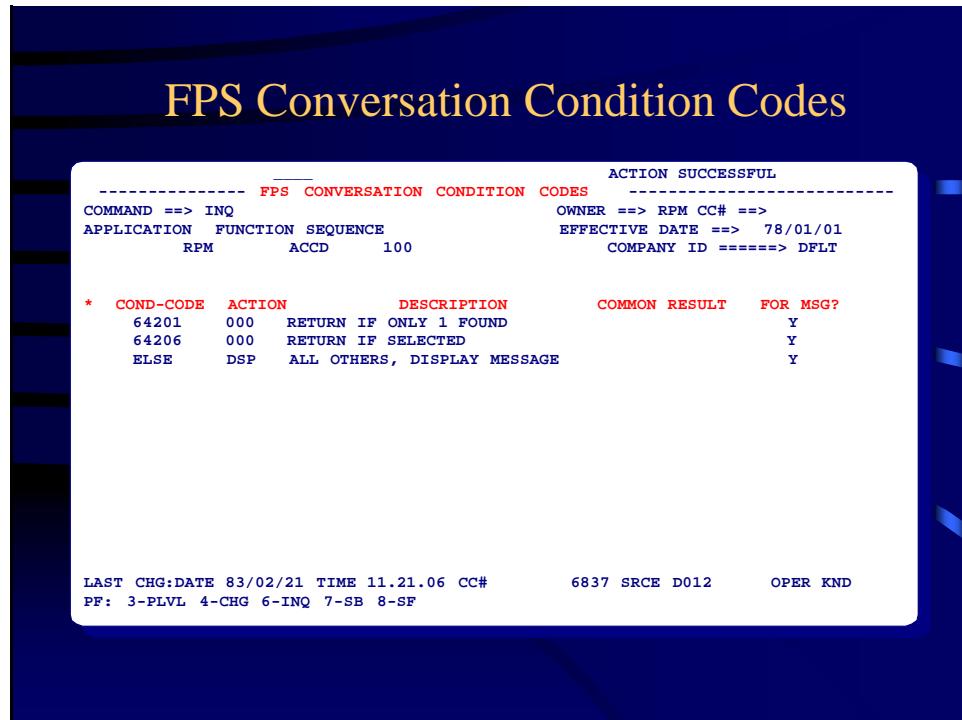

Notes:

Umbrella Programming

Branch/Exec (Increase Level) Logic

To display the FPS CONVERSATION CONDITION CODES press the PF8 key.

FPS Walkthrough--Request for a Data Group

Having previously accessed the UMBRELLA System Master Menu by keying in the 'UMBR' transaction, the operator now enters the prompt 'DG' in the COMMAND field, and presses the ENTER key.

Since the tran code for the UMBRELLA System Master Menu is 'UMBT,' PEM looks up this transaction on the Process Dictionary. The transaction contains three activities. The first, 13587, was also called from the 'UMBR' transaction and allocated FPS data groups. The second, 48300, is a Data Communications activity which deblocks map U48100M. This map contains the FPS header information for the UMBRELLA application. The third, 13551, was also issued by the 'UMBR' transaction and is a link to program I53551, the FPS supervisor.

SCENARIO - CTF STATUS REVIEW

As the FPS supervisor receives control, review the previous transaction's CTF status.

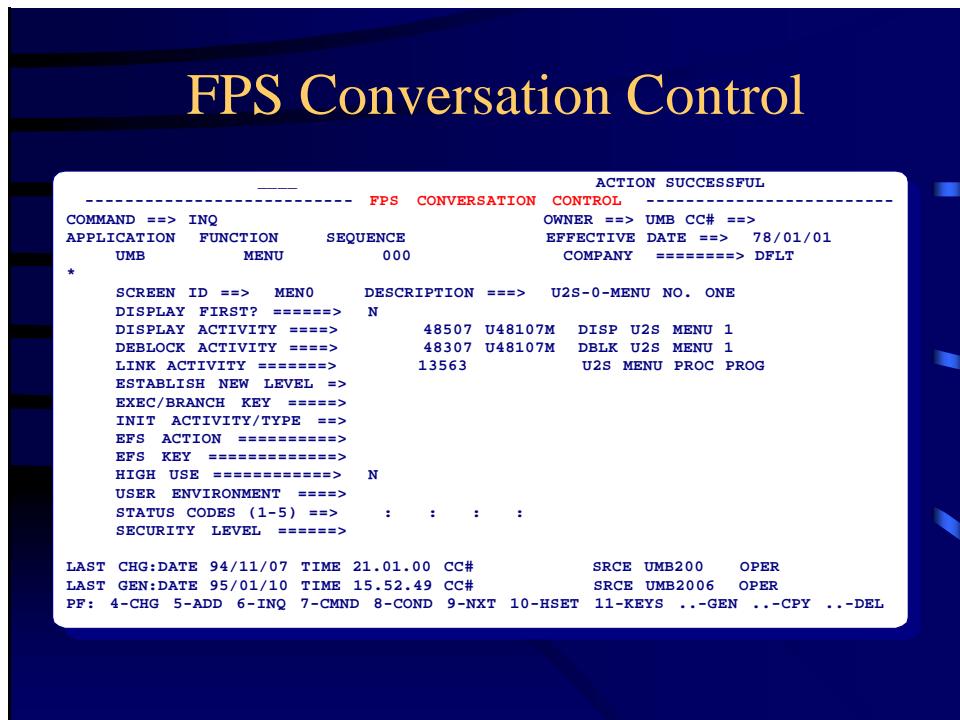

Notes:

Umbrella Programming

Branch/Exec (Increase Level) Logic

The FPS supervisor compares the Application ID of the 'UMBT' transaction with the Application Table and identifies the transaction as one associated with the 'UMB' application. The Function ID of this transaction does not match the field UMB-RESET-TXN, so the supervisor reads the information placed in Data Group 13589 from the header and builds the key to the CTF. The data groups saved on the CTF are restored, and the key to the FPS control entry, which in this case is UMB/MENU/000, is retrieved. The FPS supervisor then reads the item with a userkey of UMB/MENU/000. The deblock activity associated with this entry is executed, causing the 'DG' prompt to be placed into Data Group ID 13589.

Notes:

Notes:

Umbrella Programming

Branch/Exec (Increase Level) Logic

The menu processor searches for a menu processing entry with the same userkey as the entry which is currently controlling FPS processing, UMB/MENU/000.

Having found the correct menu entry, the menu processor finds a match for the 'DG' prompt entered by the operator. The program then places the values 'UMB', 'DG01', and '000' into Data Group 13589, sets a condition code of 0, and ends.

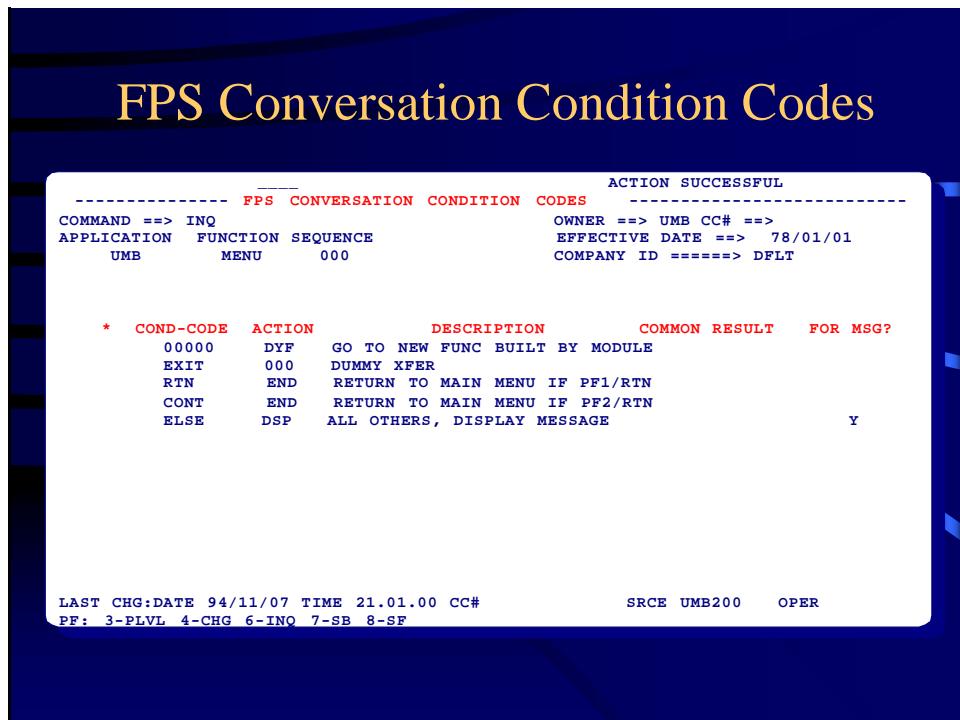

Notes:

Umbrella Programming

Branch/Exec (Increase Level) Logic

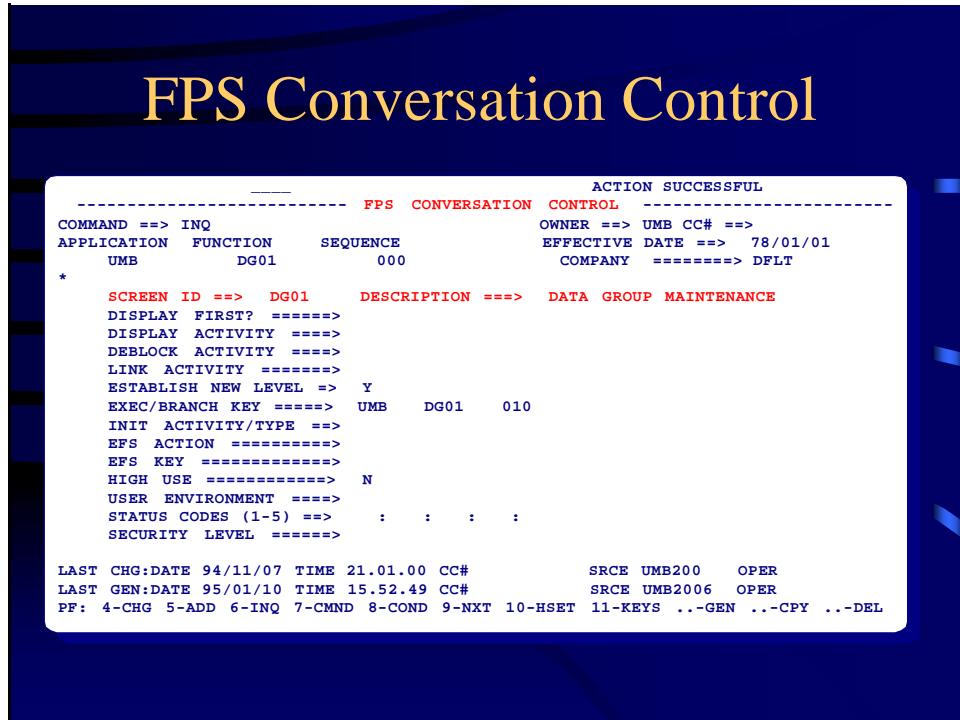

The FPS supervisor resumes execution and checks the control entry with a userkey of UMB/MENU/000 for the condition code action associated with a condition code of 0. Since the action is DYF, the supervisor builds the new userkey UMB/DG01/000 from the values placed into Data Group 13589 by the menu processor, finds the Conversation Control entry with that userkey, and uses its instructions to continue processing.

Notes:

The control entry with a userkey of UMB/DG01/000 specifies that a new processing level be established and that the item with the userkey UMB/DG01/010 be used to control processing. Therefore, the FPS supervisor causes the data associated with the menu to be saved on the CTF and searches for the control item with the userkey UMB/DG01/010.

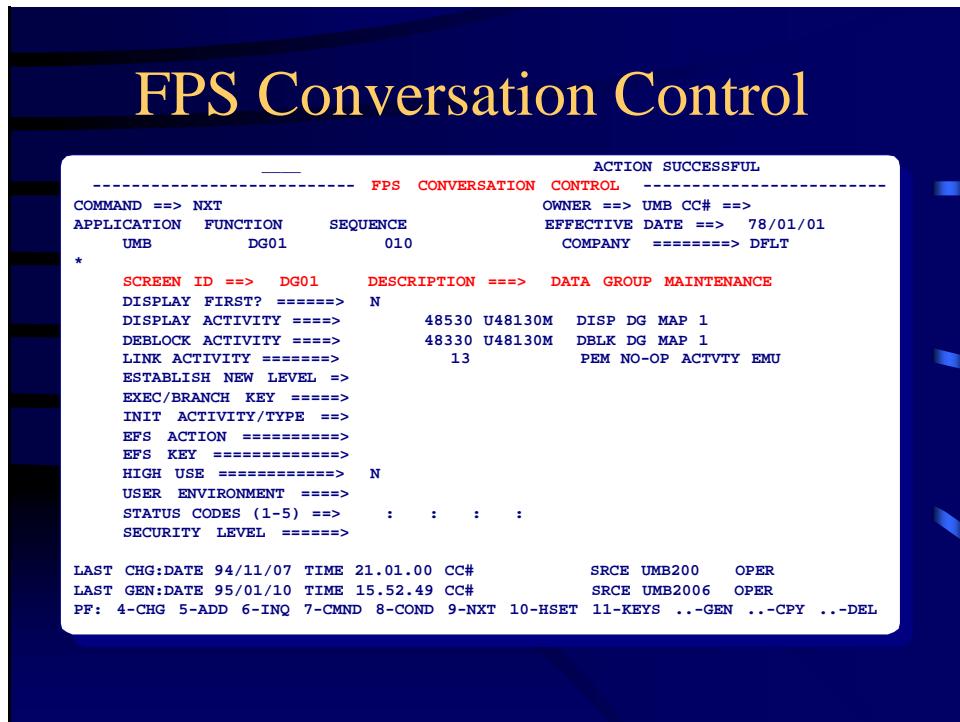

Notes:

Umbrella Programming

Branch/Exec (Increase Level) Logic

This entry causes link activity 13, which is a link to a NO-OP program, to be issued. Of course, when this program finishes execution, the value of TCB-USER-CC is still 0.

Notes:

Umbrella Programming

Branch/Exec (Increase Level) Logic

The FPS supervisor checks for the condition code action associated with a condition code of 0 and falls through to the ELSE condition. This line changes the sequence number of the userkey to 100 and sets the Common Result field to 48129.

FPS Conversation Condition Codes

PF: 3-PLVL 4-CHG 6-INQ 7-SB 8-SF					

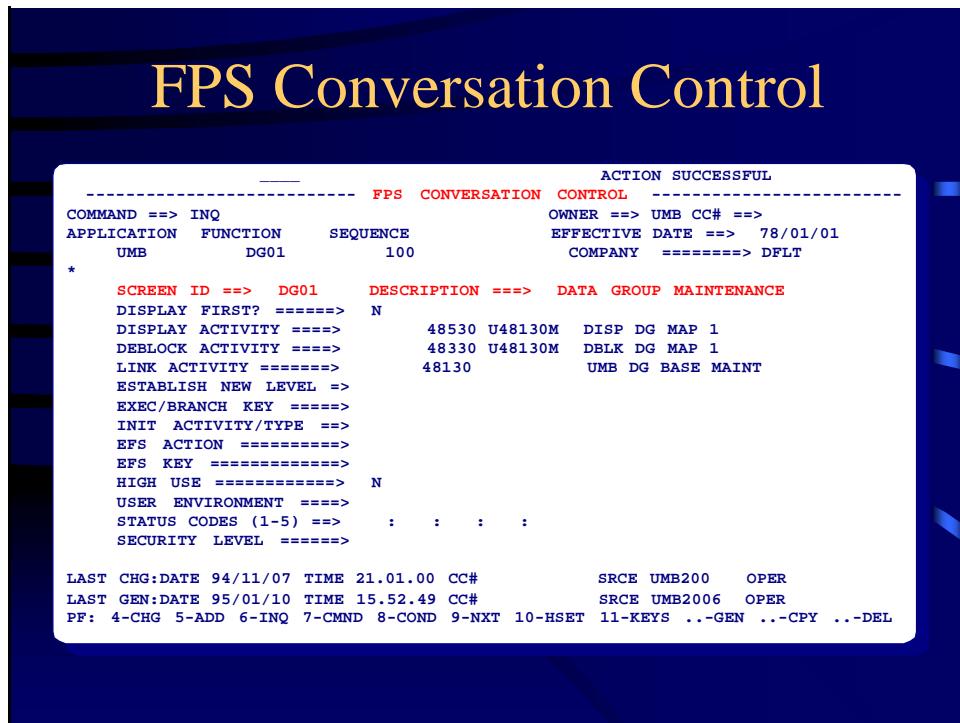

Notes:

Umbrella Programming

Branch/Exec (Increase Level) Logic

The control entries are again searched, this time for userkey UMB/DG01/100. The entry specifies that link activity 48130 be executed. Activity 48130 causes program U48130, the data group base maintenance program, to execute. The program executes and discovers that no Data Group ID has been specified. Therefore, it sets a condition code of 48355 and program U48130 ends.

Notes:

The FPS supervisor checks condition code 48355 against the condition code values listed on the entry with a userkey of UMB/DG01/100. Since there is no exact match, the action associated with the ELSE condition is used, and display activity 48530 is requested. As with all display activities, before the activity is actually executed, all data groups referenced on the map to be displayed, as well as all global data groups and data groups 13590 and 13591, are written to the CTF.

Notes:

Umbrella Programming

Branch/Exec (Increase Level) Logic

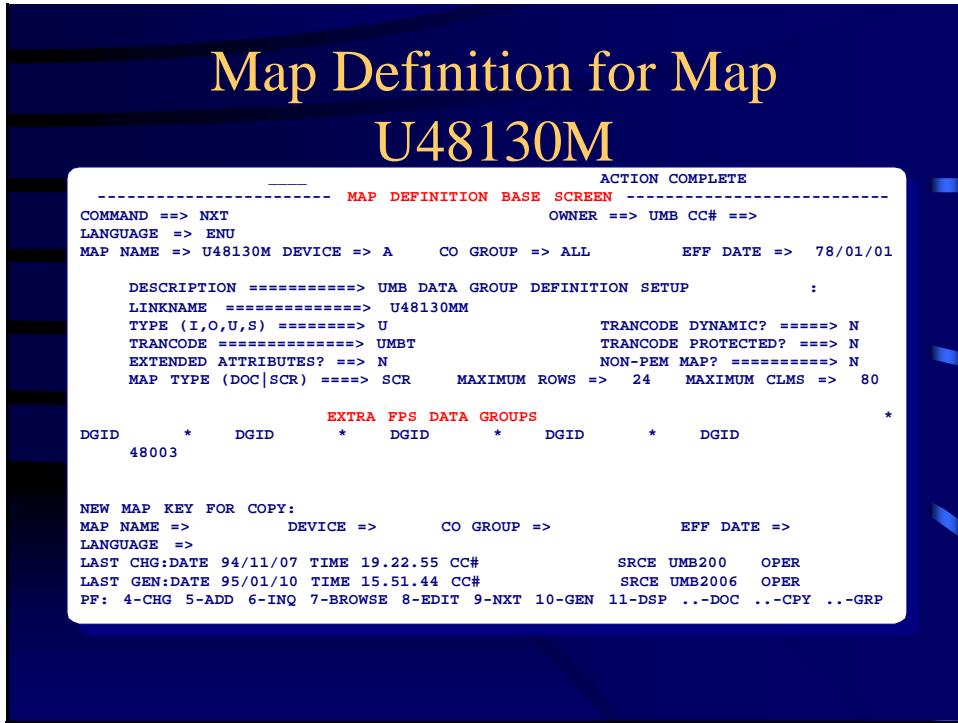

Activity 48530 requests a display of map U48130M. Once this display has been accomplished, the transaction ends. As before, the tran code associated with this map is 'UMBT'.

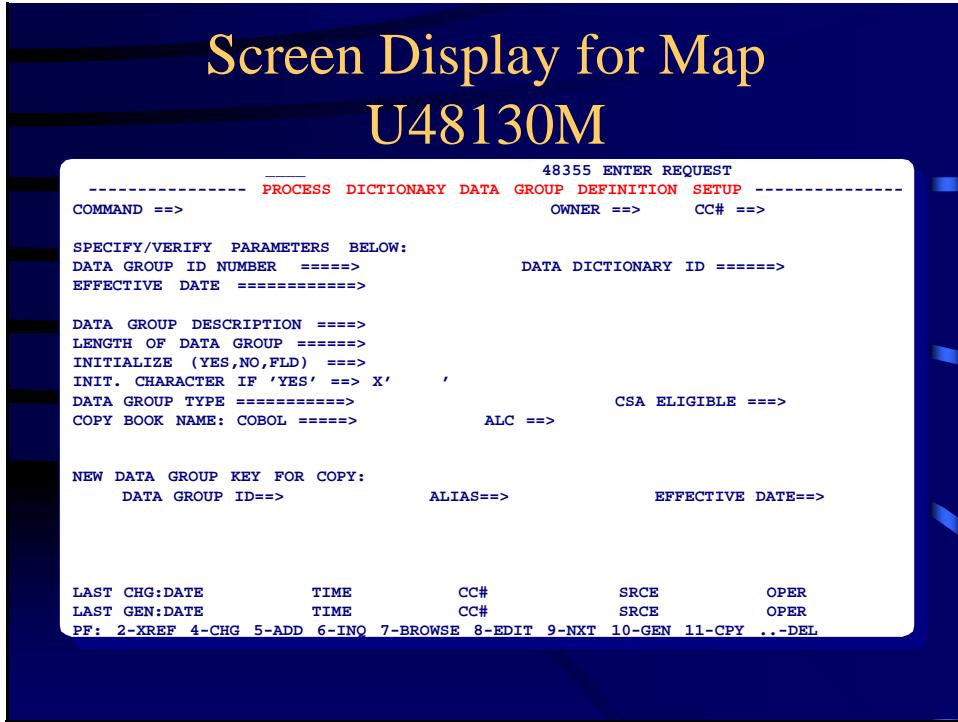

Notes:

The Map Definition for map U48130M.

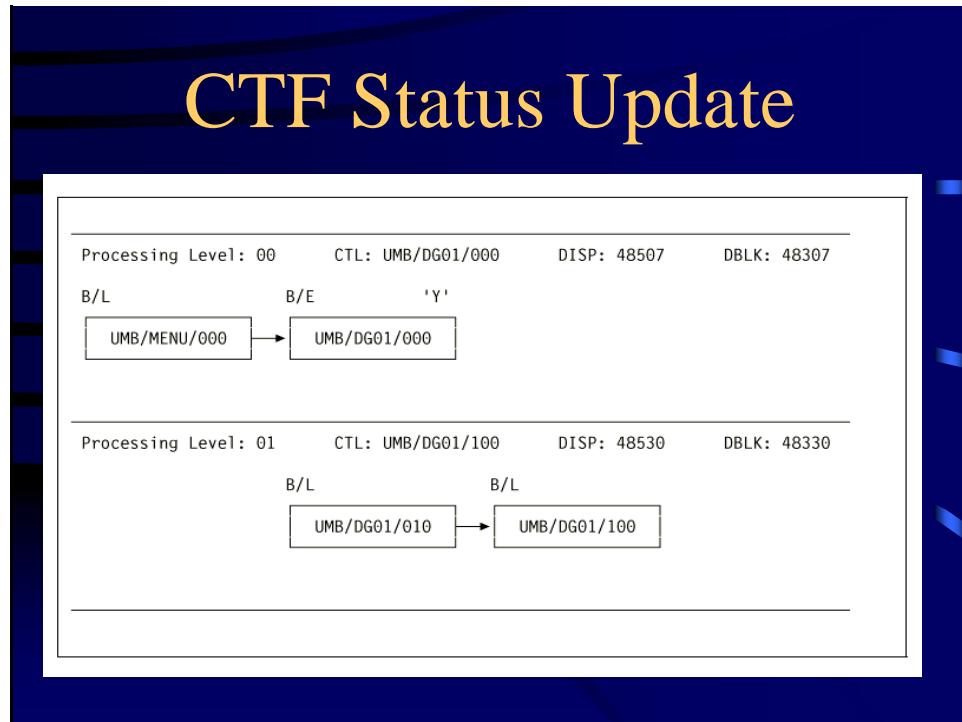

The Screen display for map U48130M.

Umbrella Programming

Branch/Exec (Increase Level) Logic

SCENARIO - CTF STATUS UPDATE

Notes:

Action -END- (Decrease Level) Logic

When an FPS conversation condition code entry is associated with the 'END' action, the effects are as follows:

1. The current processing level number is decreased by one
2. The new current processing level status and datagroups are restored from CTF
3. The control entry for the new current processing level to be established is reread
4. The condition codes in the reread entry are checked to determine what action to take next.

Walkthrough of END Logic

Having completed an inquiry on a data group definition, the operator enters the 'PLVL' command. Since the 'UMBT' trancode was associated with the data group maintenance map, PEM again looks up the transaction definition associated with this trancode and again executes a work area activity to allocate the data groups used by FPS, a data communications activity to deblock the map's header, and a link to the FPS supervisor.

The FPS supervisor uses the header information to locate the appropriate record on the CTF and restores the data associated with the data group maintenance map. This record contains the ID of the deblock activity listed on the last control entry, activity 48330. This activity is executed, causing the remainder of the map to be deblocked.

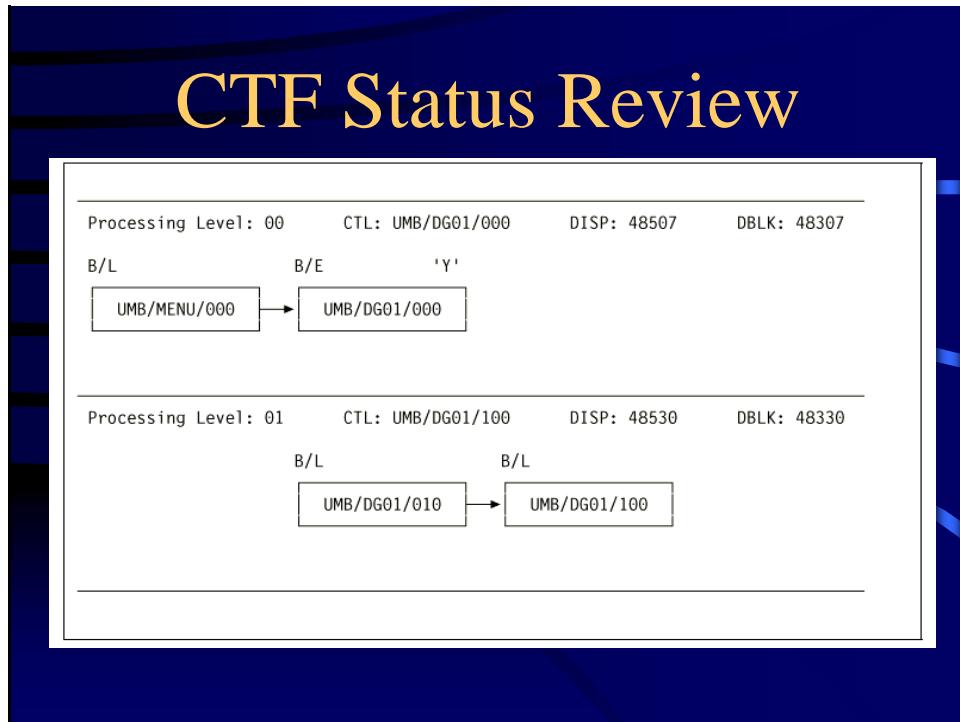

Notes:

Umbrella Programming

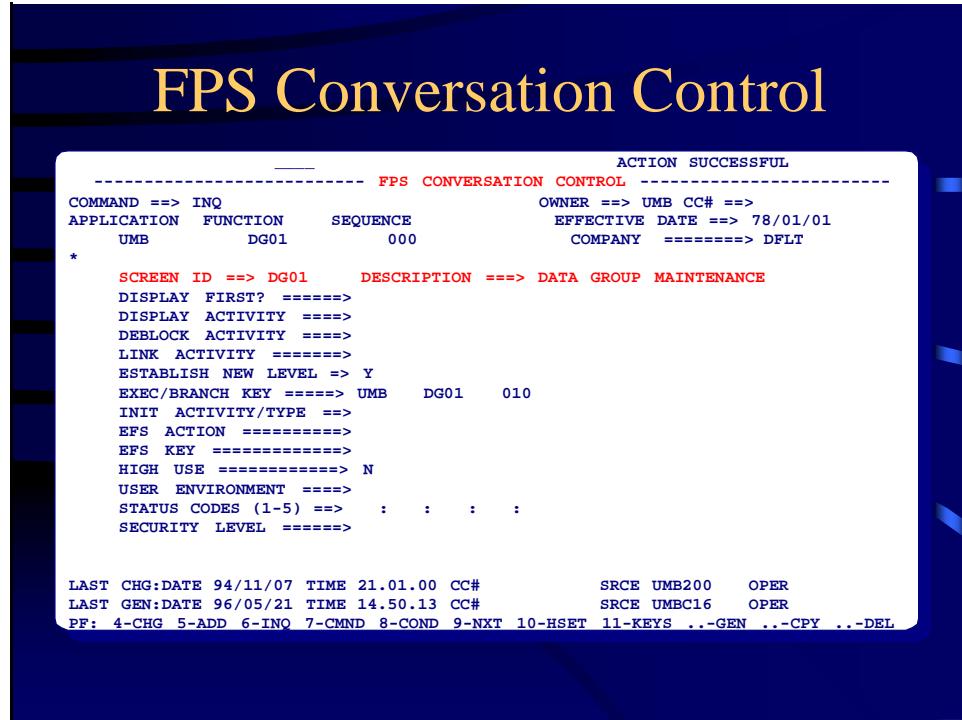

Action -END- (Decrease Level) Logic

SCENARIO - CTF STATUS REVIEW

Notes:

The FPS supervisor recognizes the 'PLVL' request as an FPS primary command. Therefore, the data on the CTF associated with the current processing level is deleted and the data associated with the previous level is restored. The entry last associated with the previous processing level, userkey UMB/DG01/000, is retrieved and is used to determine the action associated with the 'PLVL' command.

Notes:

Umbrella Programming

Action -END- (Decrease Level) Logic

FPS Conversation Condition Codes

Sort Activity

CSC

SORT Activity

- Like COBOL sort verb
- Application action opposite to exit type.
- 3 types:
 1. Input
 - Application program loops, writing records to SORT
 - Application program moves DGA-CLOSE to DG action code
 - Sort executes SORT parameters
 - PEM writes all sorted records to named SDB

© 2001 CSC. All rights reserved

Notes:

Umbrella Programming

Sort Activity

SORT 'Out' Activity

2. Output

- PEM passes all records in named SDB's to SORT
- Sort executes SORT parameters
- Application program loops, reading records from SORT until DGR-END-DATA

© 2001 CSC. All rights reserved

The sort activity enables the application program to dynamically sort a file without a separate job step. It is analogous to the COBOL verb SORT.

The sort activity interface is identical to sequential data base activities. That is, data bases are opened, closed, read, and written. The type of sort exit that is used depends on the activity definition.

If the input sort activity is used, the application program will be writing records to sort. When the application program requests a close action, PEM will then write all the sorted records to the sequential data base named in the sort activity.

If the output sort activity is used, the application program will be reading the output of sort. That is, PEM will pass all the records in the sequential data base named in the activity to sort and will pass the output records one at a time to the application program.

If the both sort activity is used, the application program will write records to sort, and after closing, read all the sorted records from sort. When the both option is used, no sequential data base is used.

The exit-type parameter refers to the activity's relationship to the sort program, while the default action represents the basic processing needs of your source code.

The default action will only work for one-half of the processing. Either the read or the write may be chosen. During the opposite half of processing, you must move the appropriate action to the DG ACTION FIELD.

Notes:

Problem Specifications—SORT Activity

1. Establish a Sort activity, 9998xx, where xx is your group number.
2. The type of activity will be SORT.
3. There will be no mnemonic for this activity ID.
4. Please include your group number in the description of the activity ID.
5. The EXIT TYPE should be OUT.
6. Use datagroup 9994xx as the I/O area.
7. The DEFAULT ACTION should be READ.
8. Input file will be EMPxxIN from last week.
9. Indicate SORT FIELDS that will sort LAST-NAME then FIRST-NAME, within your I/O area.
10. Enter values from the change control number you created.

Notes:

Problem Specifications—SORT Access

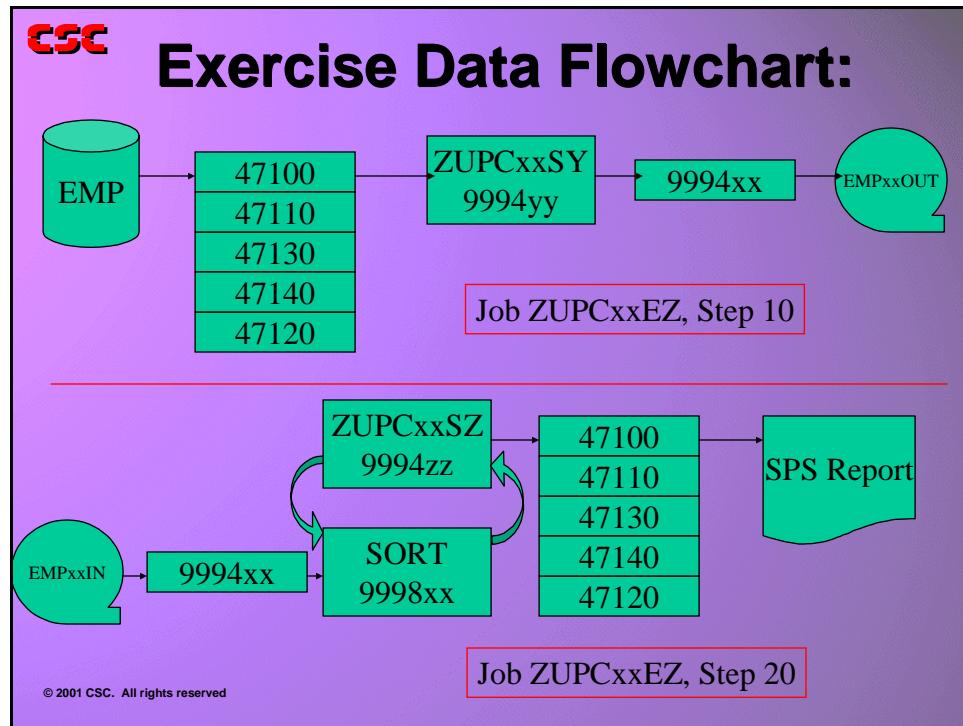

SORT Activity - Exercise I

1. Construct ALL of the necessary Process Dictionary components needed to support a batch JOB ZUPCXXEZ.
2. The first step of ZUPCXXEZ will execute program, ZUPCxxSY (where yy is your group number + 20), that will sequentially read the EMP hierarchical database and write an SDB record for each employee, with a record format mapped by datagroup 9994xx (where xx is your group number).
3. The second step of ZUPCXXEZ will execute program, ZUPCxxSZ (where zz is your group number + 40), that will incorporate SORT activity 9998xx, replacing the SDB input activity 9995yy, move each SDB field element back to its original HDB field element, and produce the same report output as program Z9994xx.
4. Enter values from the change control number you created in Chapter 5.
 - SDB definition, EMPxxOUT, where xx is your group number, was created in a prior exercise.
 - SDB activity, 9995xx, where xx is your group number, was created in a prior exercise.

* THE FOLLOWING COPYBOOK P49023D CONTAINS THE POSSIBLE VALUES  
* THAT MIGHT BE CONTAINED IN A DATA GROUP RESULTS FIELD AFTER  
* A PEM DATA BASE ACTIVITY HAS BEEN ISSUED. DGR RESULT  
* # # #  
* WHEN CONTROL IS RETURNED TO AN APPLICATION PROGRAM ON  
* COMPLETION OF A DATA BASE ACTIVITY, EACH DATA GROUP INVOLVED  
* IN THE ACTIVITY WILL CONTAIN A RESULT CODE REFLECTING THE  
* RESULT OF THE REQUESTED ACTION. IF EACH INDIVIDUAL DATA  
* GROUP'S RESULT FIELD IS ZERO, THE TCB RESULT FIELD  
* (TCB-RESULT) WILL ALSO CONTAIN ZERO.  
*  
* TCB-RESULT WILL BE SET TO NON-ZERO IF ANY OF THE INDIVIDUAL  
* DATA GROUPS IS NON-ZERO. IT IS THE RESPONSIBILITY OF THE  
* APPLICATION PROGRAM TO DETERMINE THE CAUSE AND SEVERITY OF  
* THE RESULT CONDITION. AN END-OF-DATA ON THE BASE DATA  
* GROUP (EOF) WILL CAUSE A NON-ZERO VALUE TO BE RETURNED TO  
* THE TCB-RESULT FIELD.

Scheduled Processing System

The Scheduled Processing System (SPS) is one of the Umbrella Application Development Support Systems. As a low-level language, SPS enables the programmer to code logic online, and using the GEN command, create an executable module, ready to use either in the online or batch environment. The structure of the SPS language consists of two types of processing parameters, or instructions, Line Definitions used to define Mainline Logic and Format Definitions used to define subroutines. Data is presented to SPS from many different sources. Both batch and online application programs can link to SPS based on a reportable incident. This data is then processed by SPS according to user-defined parameters to sort and format the data. SPS is a utility language, designed to utilize the features and constructs of the Umbrella System. Its most frequent use is the capture and subsequent printing of reportable data.

The processing parameters are stored on PCDs so that they can be defined and maintained external to the user programs. They allow the user to specify rules for many program/report processing tasks, including:

- Identifying elements for sort keys
- Formatting data
- Defining criteria for special processing due to changes in data (break processing)
- Clearing, rolling and accumulating totals
- Defining page overflow and page heading criteria

SPS Execution

An application program or batch job stream can invoke the SPS subsystem by issuing a link to program ID 1850. The exact form of processing performed by the subsystem is determined by the value of the link activity and the Line Definition ID. For example:

- If the link activity has a value greater than 1255, then SPS executes either the implosion phase or a unit program. The Report ID takes the same value as the ID of the activity that linked to SPS.
- If the link activity is 1250, then SPS performs the explosion or output phase.
- A link activity of 1251 will invoke HEADING processing
- A link activity of 1255 invoke BREAK processing.

This class will focus on SPS as a data reporter.

SPS Report Production Phases

The creation of an SPS report involves four phases. They are:

1. Implosion
2. Sort
3. Explosion
4. Output

The purpose of the implosion phase is to build a data string record based on a reportable incident from an online or batch application. Data string records are written to a sequential file for later batch processing. Data string records, data group 3601, contain three areas:

- The Hogan Key contains the data string ID, the report id and several other fields.
- The User Key contains the data field(s) needed to control the sort sequence of the report.
- The User Data area contains the data fields to be printed on the report. Any field from the data string may be formatted to the print line.

The remaining three phases of sort, explosion, and report production are executed in a batch job or job steps.

During the sort phase, the data strings records are sorted. The user can supply a sort activity, or default to the delivered sort activity 16400.

During the explosion phase, the data groups are rebuilt. The data fields loaded into the data string record during the implosion phase are moved into the application data group(s) so that the data fields can be accessed for printing.

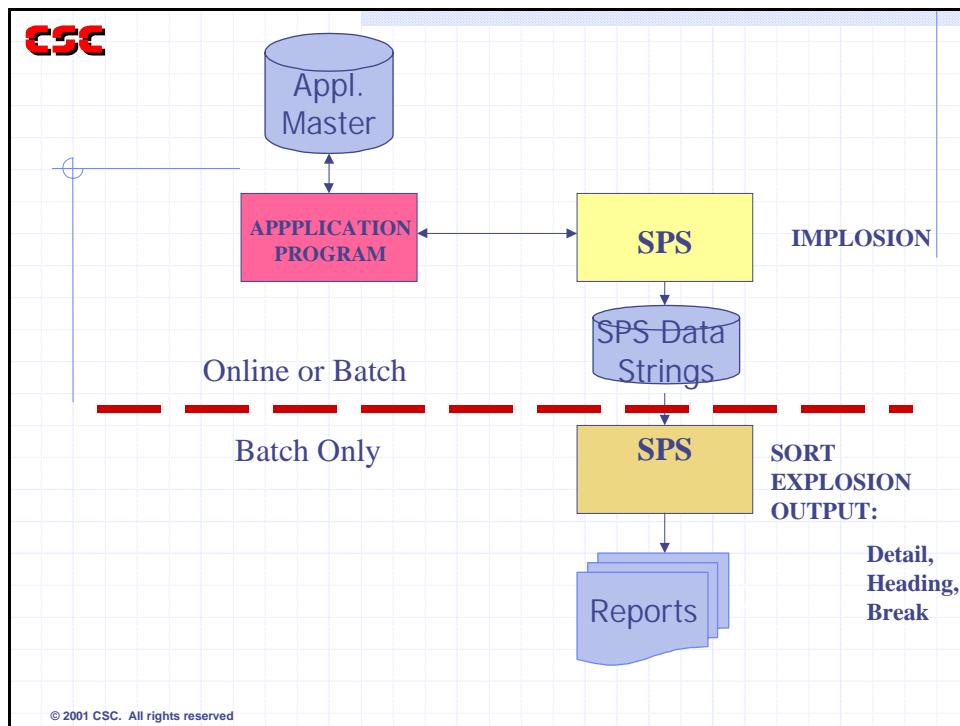

During the output phase, the data fields are moved or edited into the print area, data group 1031, and printed. Multiple print lines may be printed from one data string record. Simple arithmetic and logical operations can be performed. SPS allows activities to be issued from its process. If a code was formatted into the data string and the report is to print the description of the code, a CDMF or PCD read activity could be coded. Break and new page logic are executed where necessary.

On the next page you will see a diagram of how SPS report production interfaces with application processing.

Umbrella Programming

Scheduled Processing System

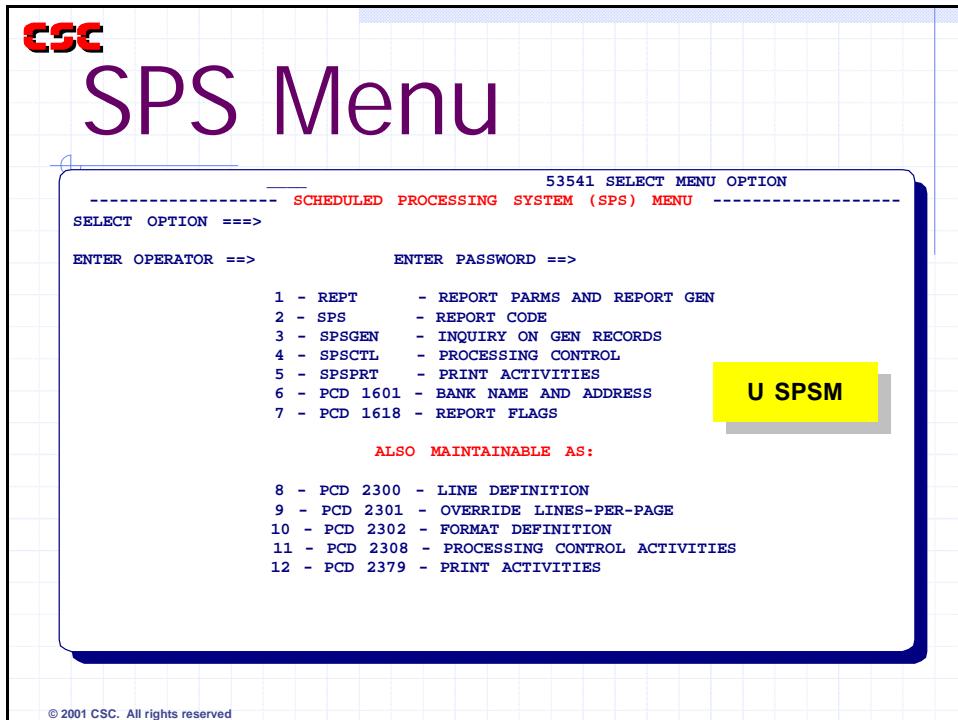

Notes:

SPS Menu Screen

SPS is a subsystem of the Umbrella that generates reports in a batch environment. Processing parameters that define a report are stored on CDMF as SPS programs, called Line Definitions, and SPS subroutines, called Format Definitions. SPS has an online language that is composed of Line Definition commands and Format Definition commands. The parameters needed to control the line and element processing of a report can be accessed and maintained online. From a cleared screen, enter U SPSM and press ENTER to display the "Scheduled Processing System (SPS) Menu".

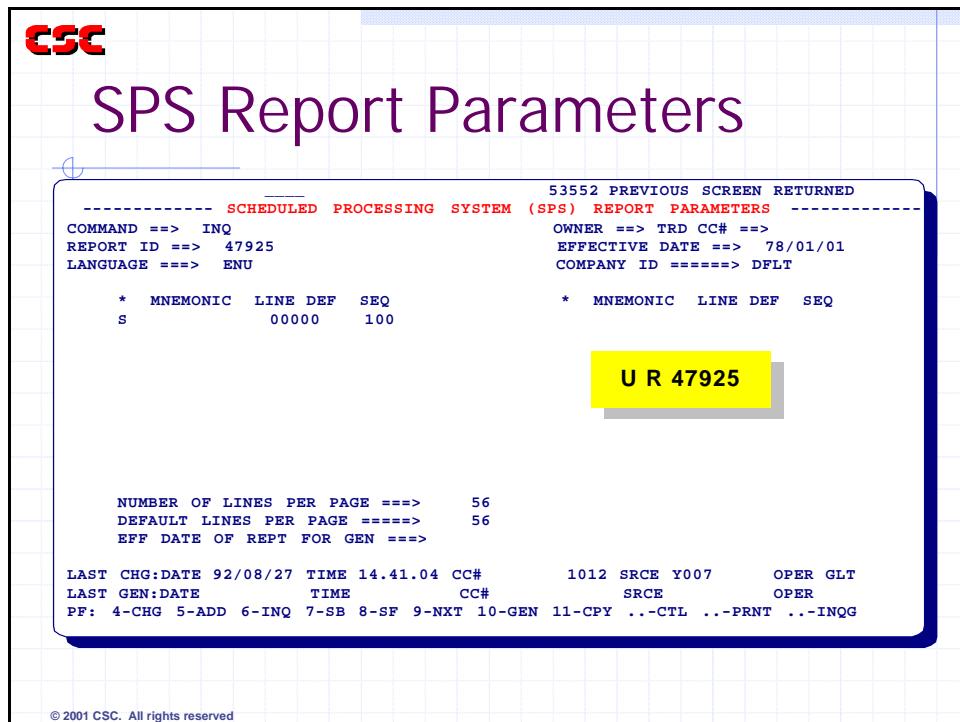

Notes:

Umbrella Programming

SPS Menu Screen

Entering Option 1 from the menu displays the "Scheduled Processing System (SPS) Report Parameters" screen.

This screen functions in a similar way to a PDS Directory containing multiple programs. Each line definition represents one program in the Directory. From this screen you can inquire on a program by entering S below the asterisk.

© 2001 CSC. All rights reserved.

This screen combines the line and format definition commands for the program and displays the start of one Line Definition for Report ID 47925. Line Definitions are keyed by Language Code, Report ID, Report Mnemonic, Line Definition, and Sequence Number. This particular Line Definition has a Language Code of ENU, a Report ID of 47925, a Mnemonic of blanks, a Line Definition of 00000, and a Sequence Number of 100. There could be other Line Definitions for this program; each would perform an independent function and would be executed independently of any other Line Definition.

The Line Definition commands are placed on the far left of the screen under the I (for instruction). A numeric value accompanies most commands. On the above screen, notice that there are three different types of command--P, A, and S. The comments on the far right indicate the function of each command. As you can see, a command of P sets the print carriage control and a command of A causes an activity to be issued.

A command of S executes a shared format definition. Shared Format Definitions contain element processing commands. They can be shared. Like Line Definitions, they are keyed by Language Code, Report ID and Mnemonic. They are also keyed by format definition. The first Shared Format Definition, S 100, has three statements in it. Each statement has its own sequence number. The comments for the statements within a format definition identify the element being manipulated or the operation being performed.

The entire program is displayed using multiple screens. To view the rest of the program definition, press PF8. The screen will scroll forward. PF7 scrolls backward.

Umbrella Programming

SPS Menu Screen

When you reach the end of the current Line Definition, the definition will wrap around to the beginning again.

Notes:

Line Definitions (Programs)

Line Definitions/SPS Programs

- ◆ One function
- ◆ Several within SPS program
- ◆ Determines
 - Program logic flow
 - Vertical spacing
- ◆ Calling programs
 - Invoke subroutines

© 2001 CSC. All rights reserved

Line Definition is the term used in SPS processing to represent logical executable entities. They are analogous to programs in traditional data processing. Line Definitions generally are written to execute one particular function, such as printing a line or moving data from an SPS Data Group to an Application Data Group.

Usually several Line Definitions are required to generate an SPS Report.

The instructions allowed in Line Definitions do little more than control report flow and vertical spacing. One command does invoke routines to manipulate data. Line Definitions, thus, are calling programs to invoke Format Definitions to manipulate data on the reports. Format definitions are analogous to performed subroutines

Notes:

Umbrella Programming

Line Definition Commands

Line Definition Commands

Line Definition processing is primarily used to control the lines of a report. In a real sense, it is a command processor. There are four primary Line Definition Commands used in this class. They are:

Line Definition Commands

- A..... Issue a PEM activity
- P.....Set printer carriage control byte
- S..... Execute a shared format definition
for the default company
- E..... End execution of a line definition

OPERAND VALUE

© 2001 CSC. All rights reserved

The four commands A, P, S, and E are discussed in this section. Additional commands are discussed as they become relevant within the course.

The general format of a Line Definition Command is:

INSTRUCTION VALUE

Where the INSTRUCTION is a letter representing the command and the VALUE is a numeric identifier associated with the command. They are coded in the Report Code Screen under the column heading "I" for instruction and value.

Notes:

A—Issue a PEM Activity

The A Command allows the user to issue PEM Process Dictionary Activities. The number of the activity to be issued is placed in the value field next to the command.

ScreenText: A 1279

Issue PEM Activity 1279. Activity 1279 is used to print an SPS Report output line.

Note: An SPS program has the authority to issue ANY activity on the Process Dictionary.

Notes:

Umbrella Programming

Line Definition Commands

P—Set Print Carriage Control

This command is used to set the printer carriage control.

P 0ABCC

VALUE SYNTAX: 0ABCC

Where: 0=ZERO

A=0 - DO AFTER

1 - DO IMMEDIATELY

B=0 - SPACE

1 - SKIP

C=XX - NUMBER TO SPACE (1-3) OR CHANNEL TO SKIP TO (1-12)

EXAMPLES: Skip to channel 1 immediately - P 01101

Space 1 after printing - P 00001

Notes:

S—Execute Shared Format Definition

The S Line Definition Command is used to execute a Shared Format Definition. (Subroutine) Shared Format Definitions contain Shared Format Definition Commands. Shared Format Definitions are also called Format Definitions. Shared Format Commands are discussed later in the class.

ScreenText: S 15010

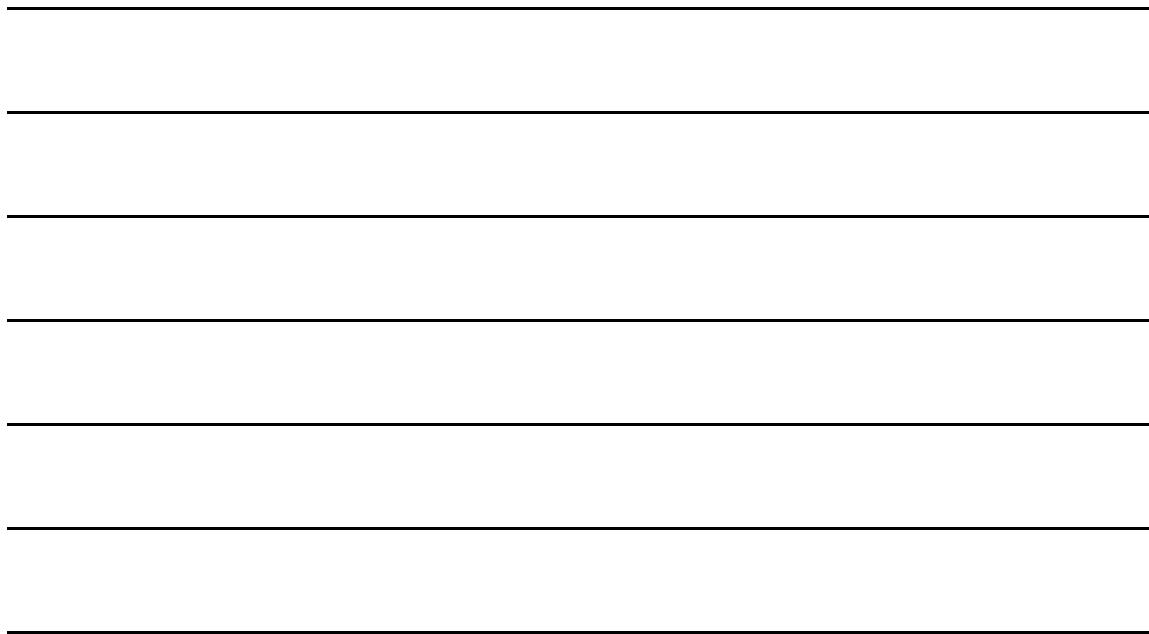

This Line Definition Command is used for tasks performed within a report. These tasks may be repeated for a given report. The command is similar to a perform of a subroutine in a COBOL program.

The S 15010 above represents the invocation of the Shared Format Definition identified by the number 15010. Shared Formats are defined within SPS Report ID/Mnemonic combinations.

Multiple invocations of the same Format Definition are possible. Just as a subroutine may be called from many different places in a COBOL program, a Shared Format Definition is invoked as many times as needed from Line Definitions under the Report ID/Mnemonic combination.

The Shared Format Definition Command is for usage only with reports for the default company (DFLT).

Notes:

Umbrella Programming

Line Definition Commands

E—End Line Definition Processing

This command ends execution of a Line Definition. Control is returned to the logic that initially invoked the Line Definition. The command is

ScreenText :

E

Each Line Definition must end with an E command explicitly coded as above.

Notes:

Format Definitions (Subroutines)

Format Definitions/SPS Subroutines

- ◆ 5 digit numbers
- ◆ Performed repeatedly
- ◆ Shared among programs within same report-ID/mnemonic combination
- ◆ Single task with few instructions

© 2001 CSC. All rights reserved

Shared Format Definitions are logical executable entities that are analogous to subroutines in traditional data processing. A Shared Format Definition is also referred to as a Format Definition in this Class Manual and the Umbrella System Support Systems Programming Guide. Format Definitions are identified by 5-digit numbers.

They can be performed repeatedly so common tasks only need to be coded once and can be reused. These subroutines can be used by Line Definitions under the same Report ID/Mnemonic combination. It is recommended that a Format Definition perform a single task and, thus, contain few instructions.

The instructions within Format Definitions are called Format Definition Commands. These commands operate on the Data Element level and are used to manipulate fields and control the horizontal spacing of a report.

There are Format Definition Commands that perform arithmetic functions, move and edit data, compare data elements, and perform GOTO functions.

Umbrella Programming

Shared Format Definition Commands

Shared Format Definition Commands

Shared Format Definition Commands:

ACTIVITY.....	ISSUE PEM ACTIVITY
ADD.....	ADD INPUT ELEMENT TO OUTPUT ELEMENT
CLEAR.....	INITIALIZE TO LOW VALUES BY FIELD TYPE
EDIT.....	NUMERIC DATA TO PRINT LINE WITH EDIT PATTERN
END.....	END EXECUTION OF A LINE DEFINITION
GOTO.....	TRANSFER CONTROL TO ANOTHER COMMAND
IF (COMPARE).....	COMPARE OUTPUT-ELEMENT TO INPUT-ELEMENT
MOVE.....	MOVE INPUT-ELEMENT TO OUTPUT-ELEMENT
PRINT.....	WRITE A LINE
SKIP.....	ESTABLISH CARRIAGE CONTROL CHARACTER
SPACE.....	ESTABLISH CARRIAGE CONTROL CHARACTER
SUBTRACT.....	SUBTRACT INPUT-ELEMENT FROM OUTPUT-ELEMENT

SPS instructions are similar to COBOL instructions, in syntax. The command must be the first word in the instruction. Words must be separated by a space. Extra spaces are ignored.

Notes:

Optional Words

The following words have no meaning to the SPS compiler and may be inserted or left out when coding instructions. SPS will insert them automatically where appropriate.

BY

FROM

GO (IF NOT USED AS A COMMAND)

GOTO (IF NOT USED AS A COMMAND)

USING.

Format Definition Commands

The order of presentation of commands in this manual is determined by function. The commands performing arithmetic functions are grouped together. Commands that set the carriage control character and print are in sequence.

Notes:

Umbrella Programming

Format Definition Commands

CLEAR Instruction

```
CLEAR OUTPUT-ELEMENT (( INDEXING) N TIMES)
OR
CLEAR OUTPUT-ELEMENT (TO 'X')
```

The OUTPUT-ELEMENT is set to zeros for packed and binary fields, character fields are set to spaces. If a value is specified, the entire field is set to the single character value.

Multiple adjacent elements with the same length and data type may be cleared for packed or binary data types. The number of these adjacent elements is specified by **N TIMES**.

ScreenTexts:

1. CLEAR TLE50109
2. CLEAR TLE50102
3. CLEAR TLE50100 07 TIMES
4. CLEAR \$01 INDEXING 20 TIMES
5. CLEAR PRTLINE
6. CLEAR PRTLINE TO '-'

EXAMPLE 1: The packed field TLE50109 is set to zero.

EXAMPLE 2: The binary field TLE50102 is set to zero.

EXAMPLE 3: All Data Elements from TLE50100 through TLE50106 are set equal to zero. These seven fields are defined contiguously.

EXAMPLE 4: The accumulators \$01 through \$20 are set equal to zero. These fields are defined contiguously.

EXAMPLE 5: The print line is set to spaces.

EXAMPLE 6: The print line is set to all dashes.

ADD Instruction

ADD INPUT-ELEMENT TO OUTPUT-ELEMENT (INDEXING N TIMES)

The INPUT-ELEMENT is ADDED to the OUTPUT-ELEMENT. The total is in the OUTPUT-ELEMENT. The INPUT-ELEMENT may be constant or packed field. The OUTPUT-ELEMENT must be packed.

INPUT-ELEMENTS can be a numeric literal or constant identified by a *. The largest value is 9999999.

If the INPUT-ELEMENT is character (not numeric) a condition code is set and processing abends.

The ADD instruction supports adding a low level set of totals to a higher level set of totals where N equals the number of adds to be performed. The accumulators within each level must be the same length. The INPUT-ELEMENTS must be packed to use this type of adding.

ScreenTexts:

1. ADD TRANAMT TO CURRBAL
2. ADD /01 TO /02
3. ADD *1 TO ITEMCNT
4. ADD \$01 TO \$0102 INDEXING 5 TIMES

EXAMPLE 1: The transaction amount field is added to the current balance field.

EXAMPLE 2: The value stored in the /01 accumulator is added to the /02 accumulator. (The SET Command establishes these accumulators)

EXAMPLE 3: 1 is added to ITEMCNT.

EXAMPLE 4: The \$01, \$02, \$03, \$04, and \$05 accumulators are added to the \$0102, \$0202, \$0302, \$0402, AND \$0502 accumulators, respectively. (The SET Command establishes these accumulators.)

Umbrella Programming

Format Definition Commands

SUBTRACT Instruction

```
SUB(TRACT) INPUT-ELEMENT FROM OUTPUT-ELEMENT ( INDEXING N TIMES)
```

The INPUT-ELEMENT is SUBTRACTED from the OUTPUT-ELEMENT. The result is placed in the OUTPUT-ELEMENT. The INPUT-ELEMENT may be character or packed data type. The OUTPUT-ELEMENT must be packed.

If the INPUT-ELEMENT is character (non-numeric) a condition code is set and processing abends.

The SUBTRACT instruction supports subtracting a low level set of totals from a higher level set of totals where N equals the number of subtracts to perform. The accumulators within each level must be the same length. The input elements must be a packed data type in this instruction.

ScreenTexts:

1. SUBTRACT TRANAMT FROM CURRBAL
2. SUBTRACT /01 FROM /02
3. SUBTRACT *1 FROM ITEMCNT
4. SUBTRACT \$01 FROM \$0102 INDEXING 5 TIMES

EXAMPLE 1: The value stored in the field TRANAMT is SUBTRACTED from the value stored in the field CURRBAL. The DIFFERENCE is stores in the field CURRBAL.

EXAMPLE 2: The value stored in the whole number accumulator /01 is SUBTRACTED from the value in the whole number accumulator /02.

EXAMPLE 3: 1 is SUBTRACTED from the field ITEMCNT.

EXAMPLE 4: The \$01, \$02, \$03, \$04, and \$05 accumulators are SUBTRACTED from the \$0102, \$0202, \$0302, \$0402, and \$0502 accumulators, respectively.

MOVE Instruction

```
MOVE INPUT-ELEMENT TO OUTPUT-ELEMENT
OR
MOVE 'XXXXXXXX' TO OUTPUT-ELEMENT
```

The INPUT-ELEMENT is moved to the OUTPUT-ELEMENT. Data conversion is performed if necessary. If the OUTPUT-ELEMENT is packed or binary and the INPUT-ELEMENT is character, but not numeric, a condition code is set and processing abends.

The maximum length of a constant is 30 characters excluding the beginning and ending quotes.

A MOVE totally replaces the contents of a field.

ScreenTexts:

1. MOVE TCE50017 TO TLE50107
2. MOVE 'PAGE' TO -125/004
3. MOVE TQE47303 TO -015/010

EXAMPLE 1: The value stored in the field TCE50017 is moved to field TLE50107.

EXAMPLE 2: The constant value PAGE is moved to position 125 of data group 1031 (the print line).

EXAMPLE 3: Illustrates the move of a numeric field to the print line or data string. The packed field is unpacked and 10 positions are moved to position 15. There is no edit pattern or sign.

If SPS must determine the length of a move, it bases the length on the sending field. If this length is not obtainable, it takes the length of the receiving field.

Notes:

Umbrella Programming

Format Definition Commands

Data String and Print Line Position Notation

The SPS PRINT LINE is formatted by moving fields to positions within DATA GROUP 1031. DATA STRINGS are created by moves to positions within DATA GROUP 3601. The position is indicated by:

-NNN / LLL

Where NNN is the starting position and LLL is the length. The position notation syntax consists of four parts:

- [. -] NNN [. -] / [. -] [. -] LLL [. -]

All parameters are optional, with the exception of the "-". The LLL parameter is required ONLY for the EDIT Format Definition and data names referencing Matrix variables.

The number range of the Shared Format Definition is used to determine which Data Group is being referenced.

Range 15000 - 16999	Data Group 3601
All other ranges	Data Group 1031

ScreenTexts:

1. MOVE TCE50017 TO -
2. MOVE TQE47204 TO -015
3. MOVE 'PAGE NUMBER:' TO -125/004
4. MOVE TQE47102 TO - /010

EXAMPLE 1: The value stored in the field TCE50017 is moved to the next available unused byte of DG3601 or DG1031, for the defined length of TCE50017.

EXAMPLE 2: The value stored in the field TQE47204 is moved to position 15 of DG3601 or DG1031, for the defined field length of TQE47204.

EXAMPLE 3: The first 4 bytes of the constant value 'PAGE NUMBER' are moved to position 125 of DG3601 or DG1031.

EXAMPLE 4: The first 10 bytes of the value stored in the field TQE47102 are moved to the next available unused byte of DG3601 or DG1031.

EDIT Instruction

EDIT INPUT-ELEMENT (IN)TO OUTPUT-ELEMENT USING EDIT-PATTERN.

The INPUT-ELEMENT is edited through a user-defined or delivered edit pattern and the result is placed into the OUTPUT-ELEMENT.

Editing is always done on packed data fields, so conversion of character or binary data types is performed as necessary. For numeric fields the edit command is usually preferred to the move.

There are two types of edit patterns:

- DEFAULT
- USER-CODED

Default Edit Patterns

There are three default edit patterns delivered.

\$	AN EDIT PATTERN FOR A MONEY ELEMENT.
/	AN EDIT PATTERN FOR A NUMBER ELEMENT.
.NN	AN EDIT PATTERN FOR A DATE

The money element edit pattern (\$) characteristics are listed below.

- Z,ZZZ,ZZZ,ZZZ,ZZZ.99-
- GENERATED FOR THE SPECIFIC INPUT-ELEMENT SIZE.
- SIGNIFICANCE FORCED AT THE DECIMAL POINT.
- HAS TWO DECIMAL PLACES.
- HAS A TRAILING DASH IF THE ELEMENT IS NEGATIVE.
- INPUT-ELEMENT PACKED DATA TYPE.

The number element edit pattern (/) characteristics are listed below.

- ZZZ,ZZZ,ZZZ,ZZZ,ZZZ
- GENERATED FOR THE SPECIFIC INPUT ELEMENT SIZE.
- SIGNIFICANCE FORCED BEFORE THE LAST DIGIT.
- HAS NO DECIMAL PLACES.
- NEGATIVE NUMBERS NOT INDICATED.
- INPUT-ELEMENT PACKED DATA TYPE.

Umbrella Programming

Format Definition Commands

The date edit pattern is described below. The NN is used to select the type of date format as follows:

.00 RESULTS THE SITE DEFAULT PATTERN.

.01 RESULTS IN A MM-DD-YY FORMAT.

.02 RESULTS IN A MM/DD/YY FORMAT.

.03 RESULTS IN A MM DD YY FORMAT.

.04 RESULTS IN A MMDDYY FORMAT.

.11 RESULTS IN A CYY-MM-DD FORMAT.

.12 RESULTS IN A CYY/MM/DD FORMAT.

.13 RESULTS IN A CYY MM DD FORMAT.

.14 RESULTS IN A CYYMMDD FORMAT.

.21 RESULTS IN A DD-MM-YY FORMAT.

.22 RESULTS IN A DD/MM/YY FORMAT.

.23 RESULTS IN A DD MM YY FORMAT.

.24 RESULTS IN A DDMMYY FORMAT.

The editing logic edits the standard packed date format of CYYMMDD into the specified format.

Notes:

User-Coded Edit Pattern

The user-coded edit pattern is like a COBOL edit mask where the following characters can be used:

- 9
- Z
- S
- \$
- -

The editing characters are replaced with digits from the INPUT-ELEMENT. Significance is forced after the first 9 or S. The Z and \$ float.

```
ScreenTexts:   ZZZ,ZZZ,ZZ9.99-
                  ZZZ,ZZZ,S99.99-
                  $$$,$$9,999.99-
```

The user may choose the fill character. If the first digit of the edit pattern is not a \$, /, ., 9, or Z, then the character is used as the fill character, such as, *9999 results in the presentation of 123 as **123.

If the user-coded edit pattern has more characters than the INPUT-ELEMENT has digits, the edit is rejected.

If the edit is accepted, the INPUT-ELEMENT is edited into a work area and then moved to the OUTPUT-ELEMENT under the following rules:

- If the edited data is larger than the OUTPUT-ELEMENT, then the OUTPUT-ELEMENT is filled with the right most digits of the edited data.
- If the OUTPUT-ELEMENT is larger than the edited data, then the edited data is moved to the left side of the OUTPUT-ELEMENT padding the right side with spaces.
- If an edit pattern of matching number of 9's to edited data occurs, SPS truncates the high order position if it is not significant.

Umbrella Programming

Format Definition Commands

ScreenTexts:

1. EDIT CURRBAL INTO -029/015 USING \$
2. EDIT ITEMCNT INTO -031/006 USING /
3. EDIT TCB\$DATE INTO -010/008 USING .02
4. EDIT DOL\$AMT INTO -081/010 USING ZZ,ZZ9.99-
5. EDIT DOL\$AMT INTO -081/011 USING \$ \$\$,\$\$9.99-

EXAMPLE 1: The field CURRBAL is edited using the delivered dollar edit pattern. The last 15 digits of the edited data are moved to print position 29.

EXAMPLE 2: The field ITEMCNT is edited using the delivered number edit pattern. The last 6 digits of the edited data are moved to print position 31.

EXAMPLE 3: The IPL DATE stored in TCB\$DATE is edited using one of the delivered date edit patterns and the edited data prints as MM/DD/YY beginning in print position 10.

EXAMPLE 4: A user-coded edit pattern is used to edit the value in DOL\$AMT.

EXAMPLE 5: A user-coded edit pattern is used to edit the value in DOL\$AMT. The \$ floats.

Notes:

SPACE Instruction

SPACE (OUTPUT-ELEMENT) N (TIMES) BEFORE/AFTER

This command is used to set the printer carriage control. N is the number of times to space either before or after printing. The maximum value of N is 3.

Once the SPACE command is executed, it stays in effect for all PRINT commands until the carriage control character is reset.

ScreenTexts:

1. SPACE 2 AFTER
2. SPACE 1 TIMES BEFORE

EXAMPLE 1: The carriage control character is set to double space after printing.

EXAMPLE 2: The printer is spaced one line prior to printing.

SKIP Instruction

SKIP (OUTPUT-ELEMENT) (TO) N BEFORE/AFTER

This instruction sets the printer carriage control for a channel skip. The maximum value of N is 12. Skip either BEFORE or AFTER printing.

Once a SPACE or SKIP command is given, it is operative for all print commands until the carriage control character is changed.

ScreenTexts:

1. SKIP TO 1 BEFORE
2. SKIP TO 12 AFTER

EXAMPLE 1: An immediate skip to channel one occurs on the next print activity.

EXAMPLE 2: At the next request for a print, the printer skips to channel 12 after printing.

Umbrella Programming

Format Definition Commands

PRINT Instruction

PRINT

This instruction generates PEM activity ID 1279. Activity 1279 is a link activity to program 1879, the SPS PRINT CONTROL PROGRAM. The program controls all involvement with the printer. Usually, the link is used to cause a detail line to be printed from data group 1031. The link is also issued along with a skip to channel 1 (top of page).

Notes:

IF (Compare) Instruction

```
IF OUTPUT-ELEMENT XX INPUT-ELEMENT (THEN)
OR
IF OUTPUT-ELEMENT XX INPUT-ELEMENT GOTO #NNNNN
```

WHERE XX IS:

EQ	- EQUAL
NE	- NOT EQUAL
LT	- LESS THAN
NLT	- NOT LESS THAN
GT	- GREATER THAN
NGT	- NOT GREATER THAN

#NNNNN is the Sequence ID of a Format Definition Command within the same Format Definition.

#EXITF can be substituted for #NNNNN. Control is transferred out of the Format Definition to the next Line Definition Command.

With the IF/THEN comparison, the OUTPUT-ELEMENT is compared to the INPUT-ELEMENT. If the comparison condition is true, the Format Definition processing continues with the next instruction. If the comparison condition is false, then the next Line Definition Command is executed.

If a GOTO is specified, the GOTO is processed on a true condition. The sequence ID (#NNNNN) specified must be within the same Format Definition. If the condition is false, processing continues with the next Format Definition Command.

DATA TYPES SUPPORTED ARE:

OUTPUT-ELEMENT	INPUT-ELEMENT
BINARY	BINARY
BINARY	LITERAL
CHARACTER	CHARACTER
CHARACTER	LITERAL/CONSTANT
PACKED	PACKED
PACKED	LITERAL

The OUTPUT-ELEMENT cannot be a constant or numeric literal.

If the OUTPUT-ELEMENT is character, the compare is set for the length of the OUTPUT-ELEMENT.

Umbrella Programming

Format Definition Commands

ScreenTexts:

1. IF TRANAMT GT CURRBAL THEN
2. IF TRANAMT LT CURRBAL GOTO #1400
3. IF TRANAMT NE CURRBAL GOTO #EXITF

EXAMPLE 1:

If the value stored in the field TRANAMT is greater than the value in CURRBAL, then processing continues with the next Format Definition Command. Otherwise, control passes to the next Line Definition Command.

EXAMPLE 2:

If the value stored in TRANAMT is less than the value in CURRBAL, control transfers to sequence number 1400 within the same Format Definition. Otherwise, processing continues with the next Format Definition Command.

EXAMPLE 3:

If the value stored in TRANAMT is not equal to the value in CURRBAL, control transfers to the next Line Definition Command. Otherwise, processing continues with the next Format Definition instruction.

GOTO Instruction

GOTO #NNNNNN

OR

GOTO #EXITF

This instruction transfers processing to another Format Definition Command. The specified sequence ID (#NNNNNN) must be within the same Format Definition.

If #EXITF is specified, control transfers to the next Line Definition Command.

Notes:

END Instruction

END

When the END command is issued by a Format Definition, the Line Definition that invoked the Format Definition is terminated.

Assume Line Definition 10 is invoked and it in turn invokes Format Definitions 100, 200, AND 300. The function of this Line Definition is to process transaction types 1, 2, AND 3. As transactions can only be of one type, processing should terminate when there is a transaction type match.

Extending this example, if the function of Format Definition 100 is to process transaction type 1, there is no need to process the two remaining Format Definitions. SPS code to accomplish this processing could use the END Format Definition command.

ScreenText:

```
LINE DEFINITION 10
    S 100
        IF TRANTYPE EQ *1 THEN
            MOVE
            MOVE
        END
    S 200
        IF TRANTYPE EQ *2 THEN
            MOVE
            MOVE
        END
    S 300
        MOVE
        MOVE
    E
```

If the EQ condition is satisfied, control falls through to the instructions that process the specific transaction type. When an END statement is executed, the Line Definition is immediately terminated.

Notes:

Umbrella Programming

Format Definition Commands

ACTIVITY Instruction

(ACTIVITY) NNNNNNNNNN

Where NNNNNNNNNN IS A PEM ACTIVITY.

This instruction allows the user to issue a PEM Process Dictionary Activity.

ScreenTexts:

1. ACTIVITY 16735
2. 16735
3. ACTIVITY 1900

EXAMPLES 1 AND 2:

The PEM ACTIVITY 16735 is executed during SPS processing. ACTIVITY 16735 writes data group 3601 to the SPS String File.

EXAMPLE 3:

Issue a link activity to Date Services.

Notes:

SPS Program Walk Through

Now that we have discussed some of the commands used by SPS, let's review Report ID 47925.

The image shows a window titled "SPS Report Walk Through". At the top left is the CSC logo. The title bar has a blue header with the text "SPS Report Walk Through". Below the title bar is a blue footer bar with the text "© 2001 CSC. All rights reserved". The main content area contains a report listing and a code listing.

Report Listing:

SCHEDULED PROCESSING SYSTEM			ACTION SUCCESSFUL
COMMAND ==>	INQ	(SPS) REPORT CODE	
LANG RPT ID	MNEMONIC	LINE DEF SEQ	OWNER ==> TRD CC# ==>
ENU 47925		00000 100	EFFECTIVE DATE ==> 78/01/01
* I	VALUE	SEQ	COMPANY ID =====> DFLT
P	1101		COMMENT
			SET PRINT CARRIAGE CONTROL

		MOVE TQE47409 TO -040	
		300	
		MOVE 'EMPLOYEE LISTING FROM DB' TO -050/024	
S	200		SHARED FORMAT DEFINITION

Code Listing:

```

LAST CHG:DATE 86/03/27 TIME 14.41.04 CC#      1012 SRCE Y007      OPER MTD
PF: 4-CHG 5-ADD 6-INQ 7-SB 8-SF 9-NXT 10-CPY 11-LINE ..-DEL

```

After positioning the printer at the top of a page by setting the carriage control to channel 1 and issuing activity 1279, this Line Definition executes format definition 100. Format definition 100 contains three move statements. Sequence number 100 is the move of the literal GROUP to the print line data group (data group 1031). The expression -034/005 indicates that the literal GROUP is to be moved to print position 34 for a length of 5.

Sequence number 200 moves a data element to print position 40. Notice that in this entry, the length of the field is not specified. Data element IDs are defined on the data group definition in columns 73 through 80. These data element IDs are the only way SPS can access a modifiable field. The COBOL copybook name of the element is provided in the comments.

Umbrella Programming

SPS Program Walk Through

To display the data element, enter U ELE TQE47409 from a cleared screen.

D or DECR in Command PF8

© 2001 CSC. All rights reserved

Format Definition 200 introduces the ADD command in sequence number 200. The *1 indicates a numeric value of 1. This amount is to be added to PAGENO, which is a field provided by SPS to record page numbers. The result of the operation will remain in the PAGENO field.

The EDIT command performs two functions. It moves the data and edits the value according to the edit pattern following the USING clause.

W04 is an SPS work counter that is being used to count lines.

Following the last command for the format definition, the screen continues with Line Definition commands. The next command sets the print carriage control to space three lines after the detail line is printed. Because this command is followed by activity 1279, the first line of the report is printed and the printer is positioned on the fourth line of the report. Issuing activity 1279 not only prints the line, but it also causes the detail line to be cleared. The P command following activity 1279 requests that the report be single spaced after the next line is printed.

Notice that spacing commands work differently under SPS than they do when you are using ASCII carriage control. With ASCII, a request for spacing occurs {before} the line is printed. With SPS, the spacing normally occurs {after} the line is printed. If you instruct SPS to space before the line is printed, the detail line will be cleared before it is printed.

Format Definition 300 contains an example of a print occurring from within a format definition. After this print is executed, SPS will be building the fifth line of the report. On the next page is a copy of what the report will look like through the first five lines. Spend a few moments comparing it with the SPS code that generated it.

Notes:

Online Coding of an SPS Program

All SPS programs are coded directly online. In this section of the class manual there are several examples for coding SPS. As in most Umbrella applications, a command and action are both required when adding, changing, and deleting code. The example below illustrates adding a Report and Line Definition to the "Scheduled Processing System (SPS) Report Parameters" screen

CSC

Adding a New SPS Program

```
ACTION SUCCESSFUL
----- SCHEDULED PROCESSING SYSTEM (SPS) REPORT PARAMETERS -----
COMMAND ==> ADD                               OWNER ==> ZZA CC# ==> 1
REPORT ID ==> 47621                           EFFECTIVE DATE ==> 78/01/01
LANGUAGE ===> ENU                            COMPANY ID =====> DFLT

* MNEMONIC   LINE DEF   SEQ      * MNEMONIC   LINE DEF   SEQ
A           00000     100

NUMBER OF LINES PER PAGE ===> 56
DEFAULT LINES PER PAGE =====> 56
EFF DATE OF REPT FOR GEN ===>

Umbrella Programming

Functions of the SPS Editor

Functions of the SPS Editor

The SPS editor is invoked during online maintenance. The editor program is module I54362. The editor verifies such items as:

- Data element names exist.
- Line Definition Commands are structurally correct.
- Format Definition Commands are structurally correct.

Whenever an error is encountered, a message is displayed and an * indicates the line in error. Multiple errors are flagged simultaneously.

Copy Feature

The CPY command allows the user to copy existing SPS programs (multiple Line Definitions), a single Line Definition, or format definitions. The copy function can be requested from several screens as follows:

- "Scheduled Processing System (SPS) Report Parameters" screen (entire SPS report)
- "Scheduled Processing System (SPS) Line Definition" screen (single SPS line definition)
- "Scheduled Processing System (SPS) Format Definition" screen (single SPS format definition).

Online Example of Copy

A useful feature of SPS is that it is possible to copy an entire program, single Line Definition, or format definition online. A copy is initiated by the CPY command from various screens, including the report parameters, report code, and format definition. These three processes are illustrated on the following pages. You can also copy from the Line Definitions screen although a copy of only the Line Definition commands is less useful than those from the other three screens.

SPS Error Messages

SPS error messages are stored along with other Hogan error messages on CDMF format 1301. The 54000-54299 number range has been assigned to SPS. Below is an example of one of the SPS error messages:

CSC SPS Error Messages Are on PCD 1301

Notes:

SPS Dumps

A PEM formatted dump is produced when a PEM exception is detected, a dump activity is issued, or a system abend condition occurs. Standard dump headers, PSW and registers at the time of abend, the abending program and offset, formatted TCB and CDMF Application Control Block, Trace table, UPCBs, and Data Group Storage are all presented in the dump.

Guidelines for using a PEM formatted dump to debug an SPS error are outlined in this section. The guidelines consist of four suggested steps. Examples are provided to illustrate each step.

Step 1—PEM Exceptions Report

Use the PEM exceptions report to determine the PEM abend message, the transaction being executed, the ID of the executing program, and the activity causing the abend. At times, this information is sufficient to solve the problem.

PAGE 0001
1 49 904 00000630
#905@7674@1128@1012@1468@1@ 00000640
#1009@8@1@SPSCLASS@0@% 00000650

11:49:53 DEMOZZ01 54208 SPS REPORT IS NOT IN SPSPGEN FILE 00001 00049 00904 00004 0000001861 0000001288

Notes:

Step 2—System/User Code

Use the system completion codes printed with PSW information to determine the nature of the abend.

If the system code is equal to zeros and the user code is a non-zero value, the executing transaction was terminated by PEM. Next locate the PEM exception message. It is printed with the formatted TCB at the beginning of the dump.

If the system code is a non-zero value when executing SPS, steps 3 and 4 are followed. Step 3 illustrates the use of the flower box when a system abend is detected. Flower boxes are provided for general errors and can identify the line of code in which the S0C7 error has occurred. Step 4 outlines data group storage to be examined when an SPS flower box is not produced or does not yield sufficient information to identify the problem.

```

Notes:

Umbrella Programming

SPS Dumps

Step 3—SPS Flower Box

The FLOWER BOX formatted by SPS contains information relevant to the report being generated. It includes the following:

```
COMPANY NUMBER
REPORT ID/MNEMONIC
LINE ID (=LINE DEFINITION NUMBER)
ACTIVITY
LINE ENTRY
FORMAT ENTRY
ERROR CODE, TYPE, AND DESCRIPTION
LAST/CURRENT LINE DEFINITION LOADED
LAST/CURRENT FORMAT DEFINITION LOADED
```

From the following example, identify the problem causing the error condition.

```
*****
*      CO=00001  REPORT=08801          LINE ID=16000
*      ACTIVITY=0000001250  LINE ENTRY=000  FORMAT ENTRY=000
*
*      ERROR CODE=54208  ERROR TYPE=SPS    ERROR=REPORT IS NOT IN SPSGEN FILE
*
*      LAST/CURRENT LINE DEFINITION LOADED:
*          CO=08888  PCDID=02300  KEY=08801
*
*      LAST/CURRENT FORMAT DEFINITION LOADED:
*          CO=08888  PCDID=02302  KEY=07627
*****
```

A second flower box is displayed in the following example. Identify the problem that caused the error condition and where the error is occurring.

```
*****
*      CO=00001  REPORT=08801          LINE ID=16000
*      ACTIVITY=0000001250  LINE ENTRY=001  FORMAT ENTRY=007
*
*      ERROR CODE=54000  ERROR TYPE=USER    ERROR=0C4 OR 0C7 ABEND DETECTED
*
*      LAST/CURRENT LINE DEFINITION LOADED:
*          CO=08888  PCDID=02300  KEY=08801
*
*      LAST/CURRENT FORMAT DEFINITION LOADED:
*          CO=08888  PCDID=02302  KEY=08801
*****
```

Notes:

Step 4—Data Group Storage

An S0C7 causes the majority of SPS dumps. When the first UPCB (User Program Control Block) in the PEM formatted dump identifies an SPS Program (I542XX), one primary SPS Data Group should be examined to find the location of the S0C7.

The SPS Processor table is contained in data group 2304, and is defined by the copybook I54204E. Elements in this Data Group to be examined are the following:

RT\$XRPT - OFFSET (1E)

THIS HEX VALUE REPRESENTS THE REPORT ID OF THE REPORT BEING GENERATED.

RT\$XMNEM - OFFSET (20)

THIS HEX VALUE REPRESENTS THE MNEMONIC FOR THE REPORT BEING EXECUTED.

RT\$XLINE - OFFSET (26)

THIS HEX VALUE REPRESENTS THE LINE DEFINITION BEING EXECUTED.

RT\$LTLOC - OFFSET (28)

THIS PACKED DECIMAL VALUE REPRESENTS THE NUMERICAL SEQUENCE OF THE LINE DEFINITION COMMAND BEING EXECUTED.

RT\$FTLOC - OFFSET (2A)

THIS PACKED DECIMAL VALUE REPRESENTS THE NUMERICAL SEQUENCE OF THE FORMAT DEFINITION COMMAND BEING EXECUTED.

A copy of a dump of data group 2304 is included in the following example for analysis.

DATA GROUP ID=0000002304
00105048 000000 00460000 0010C460 028A3E80 00000000 00000000 00000000 00000000 000012261 *.....D-...../* 00105068 000020 40404040 40403E80 001C007C 00000000 00000000 00000000 00000000 00000000 * ..-...../* 00105080 000040 00000000 00000000 00000000 00105E10 00000000 00107F00 00000000 001080C0 *.....-...../* 001050A8 000060 00000000 900D9CBA 000D9C60 0045BAC 00108120 00000000 00007AC8 00105048 *.....-..\$.....H...../* 001050C8 000080 00105E88 00049996 0004A160 00045AD8 000D9C60 0000D850 000DAC60 000D9C60 *.....-..Q.....-..Q.....-../* 001050E8 0000A0 001083C4 00108120 00108060 00007AC8 00105048 00105E88 0010BF9C 00108160 *...D.....-..H.....-../* 00105108 0000C0 0010BEFO 0010BF94 0004588A 000DAC60 000D9C60 00105178 A00D9FAC 00108326 *...O.....-..-...../* 00105128 0000E0 00000000 00000000 00003E80 00108120 0010C344 00007AC8 00105048 00105E88 *.....-..C.....H...../* 00105148 000100 0010BF9C 600DBC4C 0010BEFO 0010BF94 00045888 000DAC60 000D9C60 00105178 *.....0.....-...../* 00105168 000120 A00DBDA0 00108326 00000000 00000000 00007E40 00108120 00105DAA 00007AC8 *.....-.....=.....).....H* 00105188 000140 00105048 00105E88 0010BF94 0010C4C0 0010C4D4 0010BF94 00045888 000DAC60 *.....-.....D.....DM.....-../* 001051A8 000160 000D9C60 0010BF00 900DA66A 00000000 000DAC60 000D9C60 00000000 00000000 *.....-.....-.....-...../* 001051C8 000180 00000000 00000000 FF000000 00000000 00008AA6 00000000 00000000 00000000 *.....-...../* 001051E8 0001A0 00000000 000015EA 01900000 0010B380 000015EB 01900000 0010B538 000015EC *.....-...../* 00105208 0001C0 01900000 0010B6F0 000015E6 01900000 0010B8A8 00000E11 30000000 00042738 *.....0.....W...../* 00105228 0001E0 0000B810 00960000 0010CF08 00000407 01F40000 00045AD8 0000B806 00C80000 *.....-.....4.....Q.....H...../* 00105248 000200 0010CFC8 0000B7FC 00320000 0010D0B8 0000B824 012C0000 0010D110 00000000 *...H.....-.....J...../*

Umbrella Programming

SPS Dumps

In the example identify the values in data group 2304:

RT\$XRPT	-	X'2261'	DECIMAL - 8801
RT\$XMNEM	-	X'404040404040'	CHARACTER - SPACES
RT\$XLINE	-	X'3E80'	DECIMAL - 16000
RT\$TLOC	-	(001C)	DECIMAL - 1
RT\$FTLOC	-	(007C)	DECIMAL - 7

Locate the problem in the copy of the SPS code below.

Notes:

SPS CDMF Structure

Most parts of SPS detail are stored as items on various CDMF Formats (simulated PCDs). As a user of SPS, you are not usually concerned with the CDMF structure. Occasions may arise, however, in debugging problems when you need to know how Line Definitions and Format Definition Commands are stored internally. SPS Line Definitions are stored as individual entries on PCD 2300.

A sample entry is displayed below.

SPS Line Definition—PCD 2300

SPS CDMF Structure

Line Definition PCD 2300

```

Notes:

Umbrella Programming

SPS CDMF Structure

Note these points regarding the PCD.

- The Format ID is 2300. FOUND CO is DFLT. FOUND EFF is 78/01/01.
- The Item Key has three parts:
 - USER KEY—Report ID (5 characters)//Mnemonic (6 characters)
 - LINE ID—Line Definition Number
 - SEQ—Arbitrary number (usually 100).
- All of the above fields are key fields and, thus, cannot be changed once the definition is added. A delete and add are required to change the value of the key.
- Line Definition Commands are read right to left top to bottom. There is a maximum of 30 Commands per PCD 2300 entry. SPS builds a new entry with a higher sequence number if more Line Definition Commands are needed.

Notes:

SPS Format Definition—PCD 2302

When an S Line Definition Command is encountered, SPS must identify the Format Definition Commands belonging to the Format Definition. Format Definition Commands are stored as individual items on PCD 2302.

Note these points about the PCD entry.

- FORMAT ID is 2302. FOUND COMPANY is DFLT. FOUND EFF is 78/01/01.
- The item key has three parts:
 - USER KEY—Report ID (5 characters)//Mnemonic (6 characters)
 - FORMAT ID—Format Definition ID Number
 - SEQ—Statement Number for the Format Definition Command.
- All of the above fields are key fields and, thus, cannot be changed once the definition is added. A delete and add are required to change the value of the key.
- Format Definition Commands are executed in numerical sequence within a Format Definition.
- Format Definitions are defined for the user key (Report ID / Mnemonic combination). They belong to the user key, not to a Line Definition. Format Definitions are SHARED among all Line Definitions for a given user key.

Umbrella Programming

SPS CDMF Structure

Using SPS PCD 2300 and PCD 2302

SPS report code and parameters are stored on various PCDs. Users do not normally use the PCDs directly. Their two primary uses are as follows:

- To maintain old reports that reference fields as explicit.
- To correct problems not obvious on the SPS Screens.

It is possible that extraneous PCD 2302 entries exist. They are not actually on reports any longer. If they exist and have errors in structure, a report may fail to GEN. In this case, the PCD entries need to be deleted directly from PCD 2302.

Knowledge of the PCD 2300 and PCD 2302 structure helps in analyzing SPS problems. To verify the actual code that exists, PCD 2300 and PCD 2302 can be reviewed.

SPS PCD are listed below.

PCD 2300

Line Definition (SPS Report ID)

PCD 2302

Format Definition Commands

PCD 2301

Override Lines-Per-Page

PCD 2308

Processing Control Activities

PCD 2379

Print Activities

Notes:

Common SPS Errors

As in any system, there are some errors that will occur frequently. The purpose of this topic is to list some frequent mistakes and their possible causes.

1. The number one error associated with SPS is caused by failure to GEN a report after a change is made. The results of this error are unpredictable because the code that can be viewed online is not that which is being executed from the SPSGEN File. REMEMBER TO GEN!!!!
2. The best debugging technique for SPS is to check all pieces of the SPS code that are generating a report. Because many rules are unbending, you have to follow them. Check all the details.

3. S0C7 ERRORS

- Check that the implosion and explosion fields are in the same order.
- Check for typing errors on a Data Element Name. You may have typed the name of a character field for a numeric one.
- Check for uninitialized fields. For example, the work fields, such as, W01, have to be initialized in simple SPS Reports.

4. BLANK REPORT

- Be sure you did not leave the carriage control byte set to a before printing setting.
- Check that you included the PRINT Command or its equivalent.

5. S001 OR S002

- This error indicates an empty data set.
- It can occur when a Data Base is not read correctly.
- It can occur when a Data String is not written correctly.
- It can occur when a write activity is incorrectly included in an explosion.

6. UNPREDICTABLE RESULTS

- An activity that should link to the SPS Processor Program, Program ID 1850, links to another program.
- Effective dates for pieces of the report are mixed.
- The E Command is left off the Line Definition.
- TLE50107 is not cleared or set in the implosion.

Umbrella Programming

Common SPS Errors

7. TRUNCATED RESULT

- The output length is too short.
- You forgot to count the commas, periods, and negative sign when calculating the length of the edited data.

8. REFERENCES TO AN UNEXPECTED REPORT ID

- Check the Report ID on the Processing Control Entry (SPSCTL).
- This field determines which Report ID is executed.

9. REFERENCES TO PAGE OVERFLOW

- Page overflow refers to the lines per page entry.
- When lines per page field is set on the Report Parameters screen, PCD 2301 entries are added. There should be entries for each print detail and break routine. Verify that all the entries exist.
- In addition, the HEADINGS ID field on the PCD 2300 entry for each detail print and break routine should be set to 1000.

10. 'P02' NOT AN ELEMENT ID

- Previous versions of SPS allowed position references such as P08, P01, and P02. They are no longer allowed. The editor attempts to translate them into an Element Name and fails.
- In GENing an SPS Report, you may discover some entries with these references. You need to delete them from PCD 2302 or correct them to the -008 form.

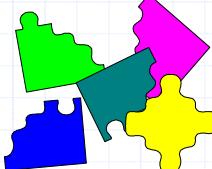

Notes:

Summary

CSC

Summary

- SPS Report Code useful for inquiring or modifying
- Line Definitions and Format Definitions contain needed commands
- SPS Report Parameters lists various reports

Umbrella Programming

Summary

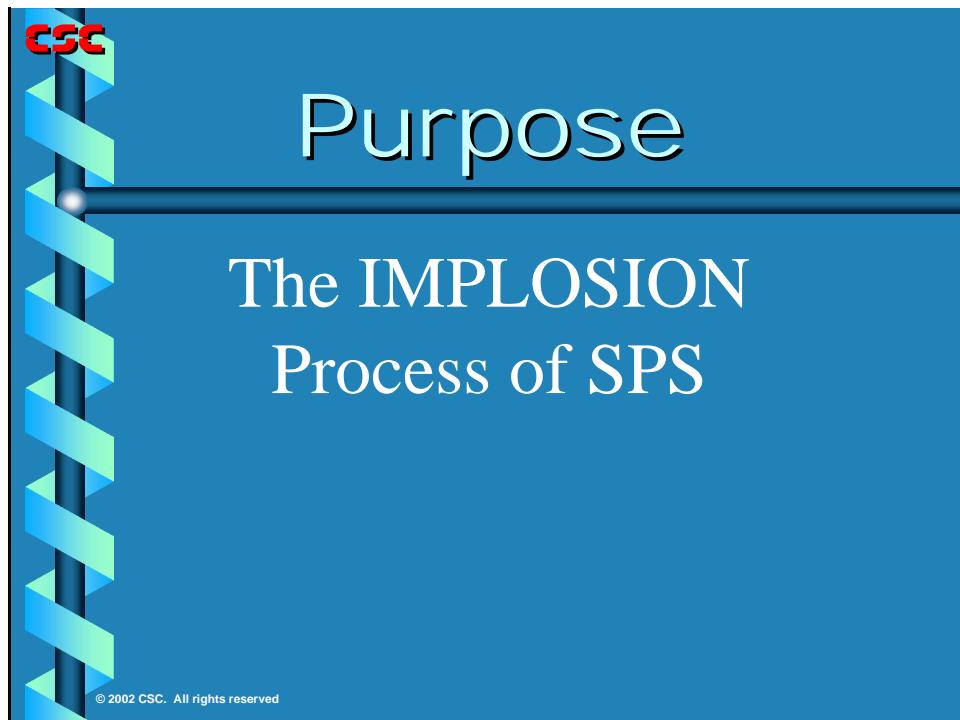

- The "Scheduled Processing System (SPS) Report Code" screen provides a useful means for inquiring on or modifying an SPS report.
- Line Definitions contain the commands needed for processing the lines on a report.
- Format definitions contain the commands for processing at the element level on a report.
- The "Scheduled Processing System (SPS) Report Parameters" screen lists the various reports for a Report ID and allows that Report ID to be GENed.
- SPS is an Umbrella tool for generating reports.
- Reports are generated through parameters maintained online in PCDs.
- There are four phases in the production of a report. They are:
 - Implosion
 - Sort
 - Explosion
 - Output
- SPS report production parameters include:
 - Line Definitions, which are equivalent to SPS programs.
 - Format definitions, which are equivalent to subroutines for the manipulation of data elements
 - Activities to be executed in the explosion and output phases of report production.
- SPS is invoked by linking to program ID 1850. The link activity indicates the type of processing to be performed.

Notes:

Overview of the Implosion Phase

Implosion Occurs

When an Application Program:

- Identifies need to capture data for deferred reporting
- Issues link activity with ID greater than 1255

© 2002 CSC. All rights reserved

The IMPLOSION phase of SPS occurs when an application program identifies a need to capture data for reporting and issues a link activity, with an activity ID greater than 1255, to the SPS Processor Control program 1850.

Implosion begins with data fields, identified by data element names, from one or more data groups. Such fields are moved to data group 3601 to create SPS Data Strings. Entire data group(s) can be moved to the SPS Data String. By storing data during the normal processing cycle as these data strings, the desired information is available for later inclusion in a report.

Notes:

Data Group 3601 Parts

- Variable record control
- Hogan key 
- User defined key and report data

© 2002 CSC. All rights reserved

Data group 3601 is used to store each data string as it is created. It has three parts: VARIABLE RECORD CONTROL, the HOGAN KEY, and USER-DEFINED KEY and REPORT DATA.

As each data string is created, it is written from data group 3601 to a sequential file. The sequential file serves as input to the actual production of the report.

Notes:

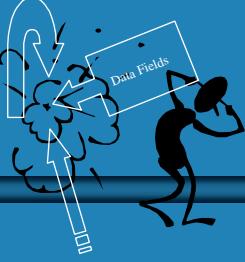

Umbrella Programming

Overview of the Implosion Phase

Implosions

- Coded as SPS line definitions
- Initiated from application program or transaction
- By a link activity to SPS
 - Must point to program ID 1850: SPS processor
 - Builds key to SPS data
 - Executes SPS implosion program code

© 2002 CSC. All rights reserved

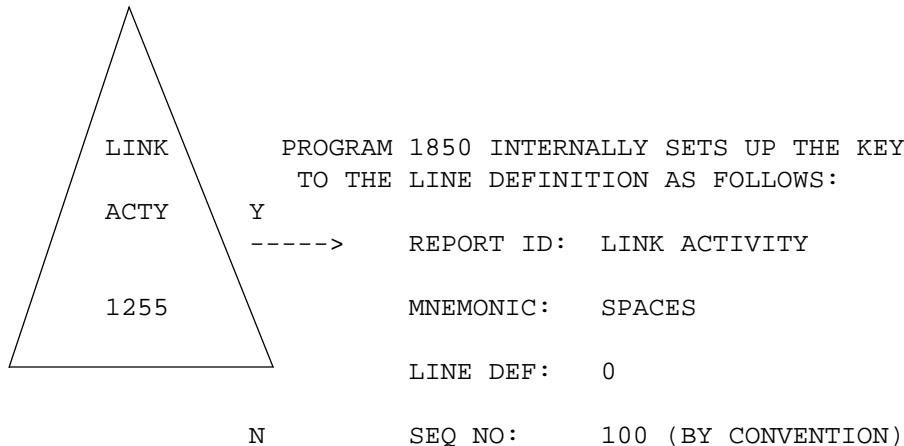

Implosions are coded as SPS Line Definitions. They are initiated from an application program or transaction. Whenever a reportable condition occurs, a link activity to SPS is issued. The link activity must point to program ID 1850, the SPS Processor. The SPS Processor builds the key to the SPSGEN data and executes the SPS implosion program code.

Notes:

Link Activity to Trigger an Implosion

Implosion code in SPS is invoked by a link activity to program 1850, the SPS Processor. The Link activity ID must be a number greater than 1255. The following diagram describes the processing decision and key built by program 1850.

SPS Implosion activities are assigned specific ranges for an application.

Several applications use the pattern 0NNRR:

WHERE	0	ZERO
NN	72 OR 76 FOR DDA	
	73 OR 78 FOR TDA	
	85 OR 87 FOR RPM	
	58 FOR OTP AND CDS	
RR	REPORT NUMBER	

Other applications use the following numbering patterns.

LOANS :	40RRR
PCS :	14RRR

WHERE	RRR IS A UNIQUE REPORT NUMBER
-------	-------------------------------

Identifying a Reportable Incident

In designing reports to meet user requirements, each data field to appear on the report must be specified. The time at which such data is created in the application environment is termed a REPORTABLE INCIDENT in SPS.

Within application processing, there would be certain logical conditions to check to identify such reportable incidents. These conditions would depend on the design of a given report.

A reportable incident might be a test during a posting run on a non-sufficient-funds (NSF) condition. This condition may need to be included on any or all of the following type of reports:

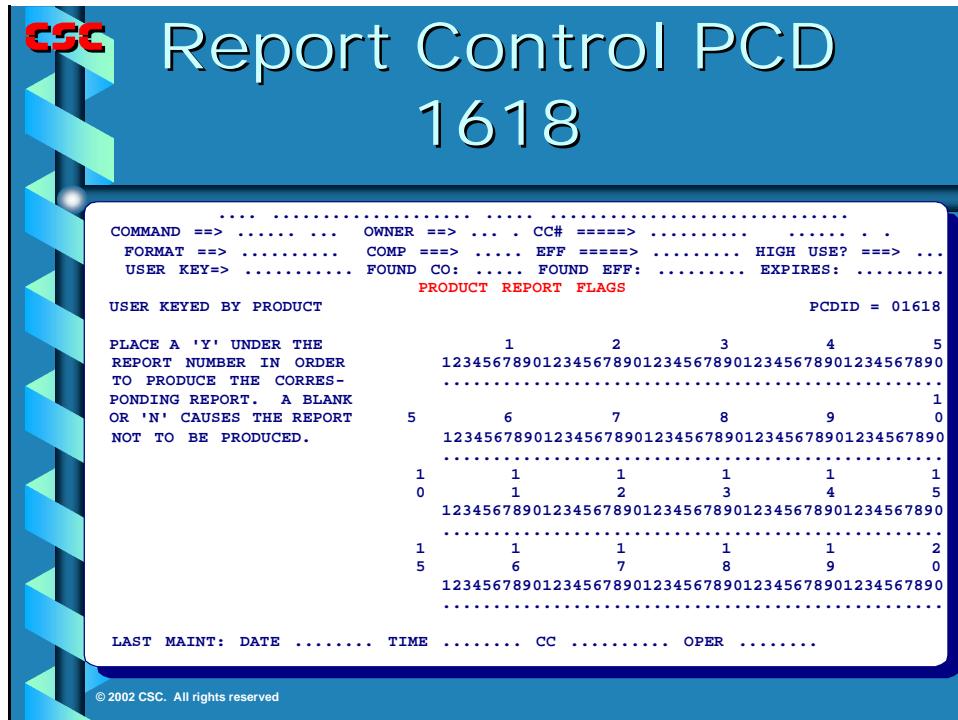

Notes:

The flowchart on the following page summarizes the processing flow in the application environment. If a reportable incident arises, control is passed to SPS program 1850 for an SPS Implosion.

PCD 1618

In the delivered reports, the reportable incidents are predetermined. A customer may not wish to produce every delivered report. There are, therefore, PCDs to allow customers to suppress any delivered reports for any specified company. For most applications, PCD 1618 is used.

PCD 1618 houses flags for up to 200 reports per application. PCD 15006 houses 40 flags. The typical coding to check on the flag to produce a report is shown by the example below:

```
BB060-POST-JOURNAL.

IF BCTL-RPT-FLAGS (1) EQUAL CC-Y
  MOVE ACTIVITY-07201
    TO TCB-LONG-ACTIVITY
  PERFORM CA000-CALL-PEM.
```

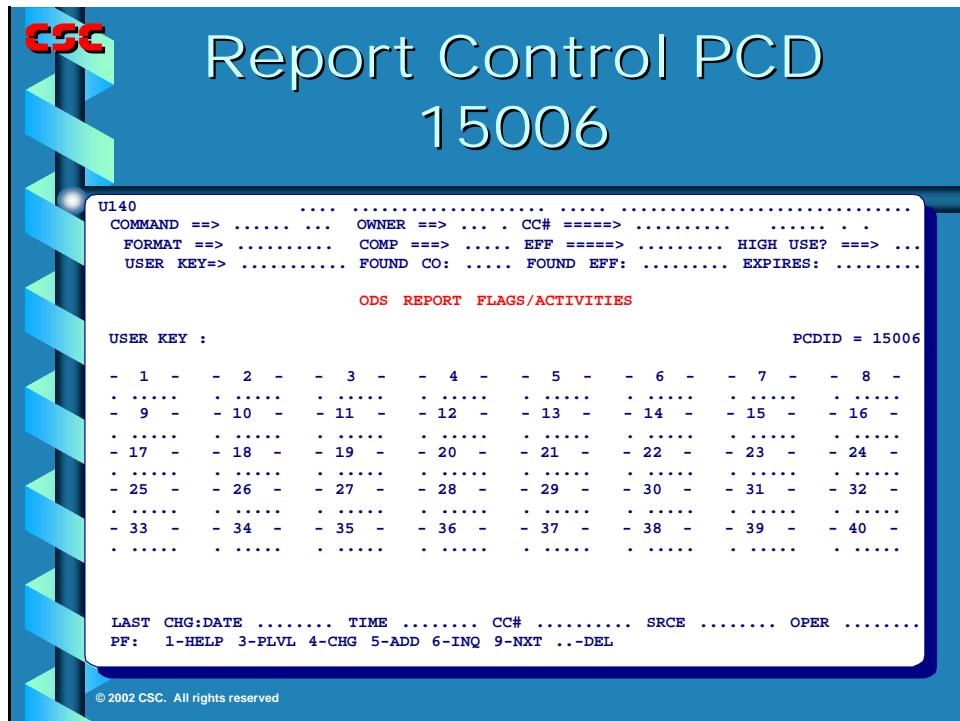

BB060-EXIT.

Activity 07201 is a link activity to program 1850, which initiates the Implosion of data for DDA report 1. If report 1 is not desired, the flag 1 on PCD 1618 is set to N.

PCD 15006

ODS uses its own table, PCD 15006. This table contains a flag and the Implosion activity ID to be used with the report.

Notes:

Illustration of the Relationships Among Data Groups in SPS

The schematic on the next page describes the interplay among data group fields and data group 3601.

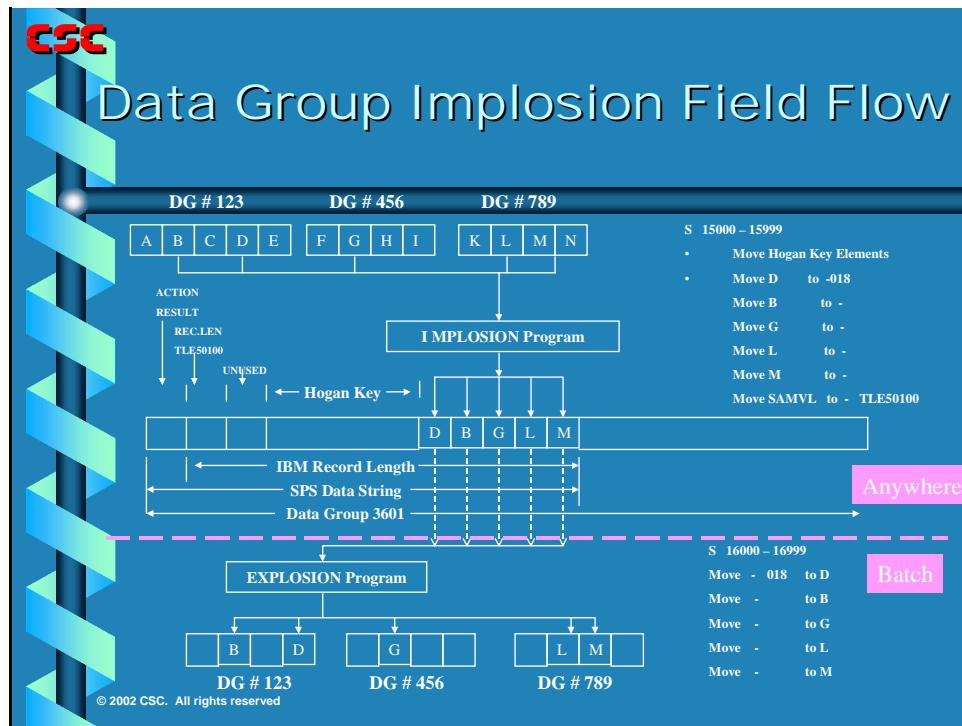

Format Definitions in the 15000 range (15000-15999) are required for SPS Implosion code. Program 1850 is hard coded to move data to data group 3601 for moves in Format Definitions in this range using the - notation.

Notes:

Umbrella Programming

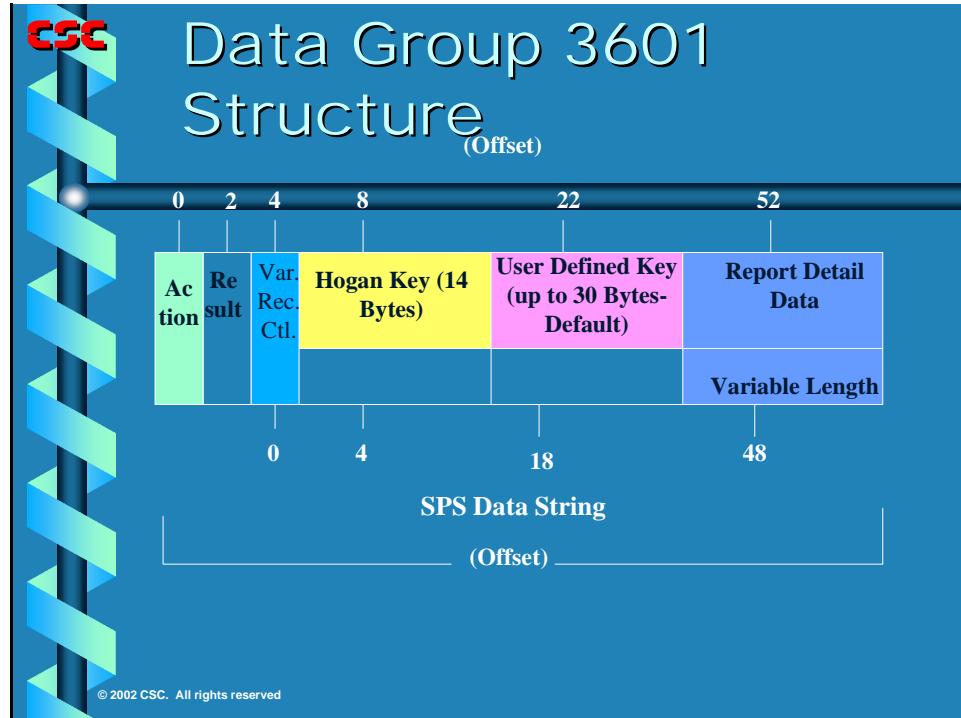

Illustration of the Relationships Among Data Groups in SPS

Notes:

Structure of Data Group 3601

Required by the operating system for variable length records.

ACTN3601 ACTION CODE	2 BYTES BINARY
TLE50100 RECORD LENGTH	2 BYTES BINARY
TLE50101 UNUSED	2 BYTES BINARY

HOGAN KEY

Used to group data strings for the same report. The Data String ID is used along with the Pass Number to access the SPS Control Entry for reports production.

ELEMENT	NAME	DEFINITION	USAGE
TLE50102	DATA STRING ID	2 BYTES BINARY	IMPLOSION ID#
TLE50103	SUB STRING ID	2 BYTES BINARY	DETAIL LINE PRINTER
TLE50104	FORMS ID	2 BYTES BINARY	
TLE50105	COMPANY ID	2 BYTES BINARY	
TLE50106	REPORT ID	2 BYTES BINARY	DETAIL PRINT SPS ID
TLE50107	BRANCH NUMBER	3 BYTES PACKED DECIMAL	
TLE50124	LANGUAGE CODE	1 BYTE CHARACTER	

USER-DEFINED KEY AND REPORT DATA

Umbrella Programming

Structure of Data Group 3601

User-selected fields are moved to the Data String starting at offset 18 of the Data String. The first 30 bytes are the user part of the sort key to control the sequence of data within a report.

Notes:

SPS Implosion Considerations

Requirements for Implosion

- ✓ May need to load 3-byte language code
- ✓ Move write action (02) to action field of data group
- ✓ Move data fields to data group 3601
- ✓ Begin user data fields at offset 018
- ✓ Specify length of data group:
 - ✓ Move SAMVL to TLE 50100
- ✓ Issue sequential data base write activity

© 2000 CSC Software Limited

There are several key points required to perform an Implosion:

- In shops that have upgraded to Umbrella 2.0, it may be necessary to load the TCB field TCB-SPS-IMplode-LANG with the 3-byte language code.
- In order to create a data string, a write action (02) must be moved to the action field of data group 3601.
- Data fields are moved to data group 3601 through move commands. Data Element Names are required. The entire data group can be moved to the Data String.
- The user data fields begin at offset 018 of the data string. The first move is to -018. The rest of the moves are to -. Implosions are required to be coded in Format Definitions within the 15000 range. Program 1850 moves the data to data group 3601 for code within this 15000 range.
- Because the user portion of the data string is variable, the length of the data group must be specified in the variable control record RDW.
- SAMVL is an internal field that totals the length of the Hogan key and user fields. It must be moved to TLE50100 after all data elements are

Umbrella Programming

SPS Implosion Considerations

moved to data group 3601.

- A sequential data base write activity must be issued. The SDB write activity can be issued directly from the SPS Implosion code or from a program linked to from the SPS Implosion routine.

Umbrella Programming

Problem Specifications—SPS Implosion

Problem Specifications—SPS Implosion

The report your program has been printing is using only a fraction of the available SPS functions. This method is very limited in that only one report can be produced and in the same sequence as the master file.

This task involves adding an SPS Line Definition for the Implosion routine. Be sure to use the correct Format Definition range. Use activity ID 16135 to write the Data String. Use an Effective Date of 780101 and Company DFLT.

A Link Activity Definition to SPS 1850 will need to be added to the Process Dictionary. The Implosion activity ID is 478yy, where yy is your group number + 20.

Each group produces its own report. The Report ID is 088yy, where yy is your group number + 20.

The Data String to be written is identified by 478yy and the Report ID is 088yy, where yy is your group number + 20. When building the HOGAN KEY, be sure to move your group number to the SUB-DATA-STRING-ID field (TLE50103) and Zeros must be moved to the branch number (TLE50107).

Write the SPS code to implode the data elements listed below. The elements are listed in sorted order. The order for the sort is DEPARTMENT, LAST NAME, and FIRST NAME.

DD-ID	ATTRIBUTES	FIELD NAME	DATA GROUP
TQE47204	PIC X(3)	JOB-STAT-DEPT	47120
TQE47101	PIC X(15)	EMP-L-NAME	47110
TQE47102	PIC X(15)	EMP-F-NAME	47110
TQE47002	PIC 9(11) COMP-3	EMP-KEY-ID	47100
TQE47206	PIC XX	JOB-STAT-CLASS	47120
TQE47207	PIC XX	JOB-STAT-POSITION	47120
TQE47902	PIC X(40)	EMP-POS-DESCRIPTION	47190
TQE47303	PIC S9(7)V99 COMP-3	EMP-C-EARN-TOT	47130
TQE47403	PIC S9(7)V99 COMP-3	EMP-Y-EARN-TOT	47140

Testing of Implosion

Use the Online Activity Driver to read the Employee Data Base, link to your SPS Implosion Routine, and dump.

1. From a cleared screen, enter TEST and press ENTER.
2. Up to 20 activities may be keyed into this screen. Key an activity ID and press the tab key to position your cursor on the next field. After all activities have been keyed, press the ENTER key.
 - 9996xx, where xx is your group number, to read the EMP Data Base to provide test data.
 - 478yy, where yy is your group number + 40, to invoke the SPS IMPLOSION program you just coded.
 - 12, this activity ID will cause an S0C7 ABEND and invoke SMART.
3. In the SMART Command, key FDG=3601
4. Check the fields in the Data String DG3601 against your SPS Implosion code.
5. The RDW should have a hexadecimal 6F, which equals 111 bytes of data.

Reportable Incident

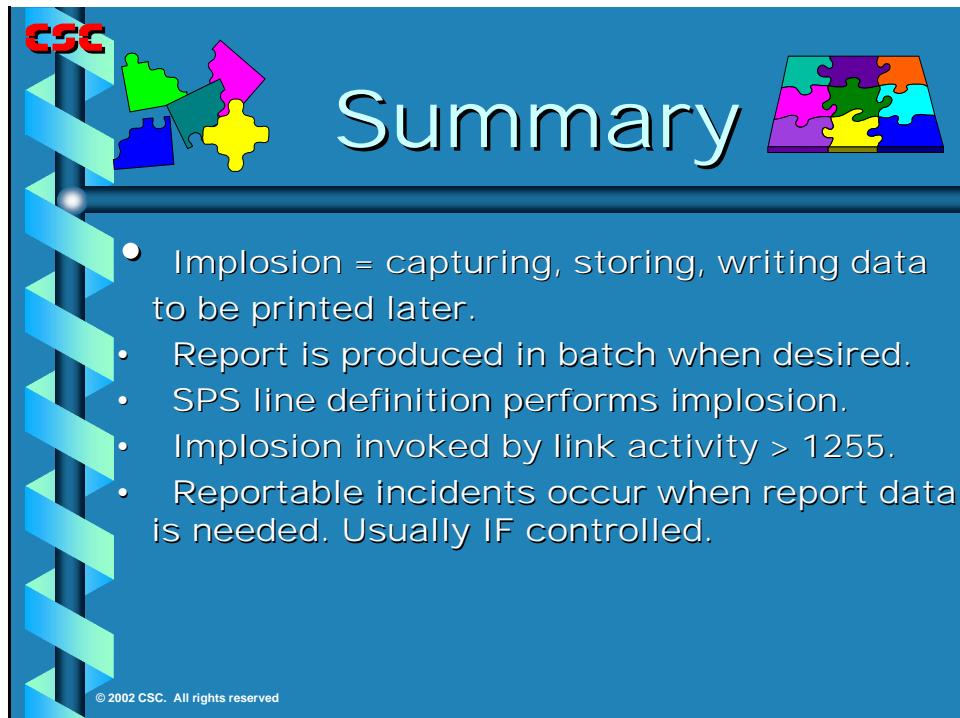

You will need to change your application program 9994xx, where xx is your group number, to test for Company 1 and invoke your SPS Implosion activity ID 478yy, where yy is your group number + 40.

Just compile/linkedit your program. Testing the program will be done after the next SPS Lab Exercise.

Notes:

Summary

The slide has a blue header bar with the CSC logo on the left and a jigsaw puzzle graphic on the right. The word "Summary" is centered in large white letters. Below the header is a list of bullet points. At the bottom left is a small copyright notice: "© 2002 CSC. All rights reserved".

- Implosion = capturing, storing, writing data to be printed later.
- Report is produced in batch when desired.
- SPS line definition performs implosion.
- Implosion invoked by link activity > 1255.
- Reportable incidents occur when report data is needed. Usually IF controlled.

- SPS captures data at the time it is normally processed and stores the data in a Data String. The Data String is written to a sequential file. This process is called IMPLOSION.
- The file becomes input to producing a report. The production is scheduled when desired.
- The Implosion is performed by an SPS Line Definition.
- SPS Implosion is invoked by a link activity to the SPS Processor, program ID 1850 with the Link activity ID greater than 1255.
- Reportable incidents occur at the time the data needed for a report exists. Logic considerations control the creation of Data Strings.
- Hogan applications are set up so delivered reports can be suppressed. Most applications use PCD 1618. ODS uses PCD 15006.
- The data is saved by building Data Strings on data group 3601. The Data String consists of the RDW, HOGAN KEY, USER-DEFINED KEY, and REPORT DETAIL.
- SAMVL is an internal field that totals the length of the Data String as it is

Umbrella Programming

Summary

being built.

- Moves to - in an Implosion routines are moves to data group 3601. Implosion routines must be coded in the 15000 range.

- Explain structure and use of Processing Control Entry
- Define explosion in SPS
- Explain relationship among data groups in Explosion and Output Phases
- Code an SPS Explosion and Output Line Definition Online

Notes:

SPS Processing Control Program

When application processing is complete, all the Data Strings created through the Implosion Phase are stored in one or more sequential files. A job is executed to process the sequential file(s) through the Sort, Explosion, and Output Phases. The following is an example job stream.

```
//  
TRNNGRPTS JOB (HOGN,058,5005),'PRINT.RPTS',REGION=2000K  
//PRINT      EXEC HOGNBPEM  
//TID1T21   DD DSN=&&STRINGS,DISP=(OLD,DELETE)  
//SYSIN     DD *  
1 49 904          ACTIVITY DRIVER  
#905@  
7674@          ACTY TO ALLOCATE DG 3601  
1128@          ACTY TO ALLOCATE DG 1009  
1012@          DC ACTY TO DBLK DG 1009  
1468@          LINK ACTY TO SPS PROCESSING CONTROL PROGRAM  
I54260  
1@          END PROGRAM  
#1009@1@1@SPSCLASS@0@%      CONTROL CARD
```

The PEM Transaction shown above deblocks the control card #1009 and then links to the SPS Processing Control Program, program ID 1698, which drives Reports Production. Link activity ID 1468 invokes the program that initiates the Sort Phase. During execution, the sequential file(s) are sorted in ascending order. One record at a time is released into data group 3601 for processing.

The SPS Processing Control Program identifies the Processing Control Entry through the Pass Number in data group 1009 and the Data String ID, field TLE50102 data group 3601. This entry contains the activities to be issued for the Explosion and Output Phases. When the Processing Control Program has processed the last Data String Record, the Report Production Job Step is complete.

Notes:

Umbrella Programming

Sort Phase

SPS Sort Considerations

The Data String File(s) created by Implosion processing must be sorted before the actual reports can be produced. The default Sort activity ID is 16400. It is defined to sort position 9 (offset 8 of the Data String) for a length of 9 and position 19 for a length of 30.

As a review, the structure of data group 3601 is as follows:

The fields of the HOGAN KEY are:

DATA STRING ID	2 BYTES
SUB DATA STRING ID	2 BYTES
FORMS ID	2 BYTES
COMPANY ID	2 BYTES
REPORT ID	2 BYTES
BRANCH NUMBER	3 BYTES
LANGUAGE CODE	1 BYTE

The fields of the HOGAN KEY included in the 16400 Sort are:

LANGUAGE CODE	1 BYTE	SORT FIELD=(018,001,A,BI)
FORMS	2 BYTES	SORT FIELD=(009,009,A,BI)
COMPANY ID	2 BYTES	
REPORT ID	2 BYTES	
BRANCH NUMBER	3 BYTES	
USER DEFINED	30 BYTES	SORT FIELD=(019,030,A,BI)

Umbrella Programming

Sort Phase

When an override of the Sort activity 16400 is needed, the override Sort Activity is specified as a parameter in the control card, data group 1009.

FIELDS WITHIN DATA GROUP 1009 ARE DESCRIBED IN THE EXAMPLE BELOW:

```
1 49 904
#905@7674@1128@1012@1468@1@
#1009@
1@          PASS NUMBER
1@          COMPANY NUMBER
SPSCLASS@   EVENT NAME
0@          EFFECTIVE DATE
@           REPRINT REPORT
17401@     OVERRIDE SORT ACTIVITY
@%          OPTIONAL COMPANY EXIT
```

Notes:

Umbrella Programming

The Processing Control Entry

The Processing Control Entry

The Pass Number from data group 1009 deblocked from SYSIN and Data String ID placed in TLE50102 in data group 3601 during the Implosion routine is used by the SPS Reports Processor program 1698 as the key to the SPS Processing Control Entry.

Pass Number field is an arbitrary value used to categorize reports. For instance in DDA, Pass 1 Reports process the Implosion Data Strings from the Daily Application Programs. The Data Strings that are imploded from Pass 1 Reports (piggybacked) are processed in Pass 2 Reports. The DDA Pass Numbers are as follows:

1	AND	2	DAILY
3			WEEKLY
4			MONTHLY AND YEAR-END

The REPORT ID is used by SPS in the explosion and output phases. It is the numeric identifier for the SPS Line Definition for report production. For Hogan applications, there is a relationship between Report ID and Report Number. For example, DDA Report CR0035 has a Report ID 35.

The SPS Processing Control Entry contains three activity list areas.

BEG OF REPT (BOR) PROCEDURES.

Activity(ies) issued once at the Beginning of the Report.

Beginning of Report activities normally set up work fields for a report, such as, accumulators and switches. Activities 7627 and 17627 are the standard housekeeping activities. Customers can modify either to meet special needs.

PROCESSING PROCEDURES.

Activities issued for each data string of a report.

These activities define the processing requirements for each data string. At a minimum, each data string must have the element fields exploded back into the original data groups and the output line created. In addition, calculations may need to be performed upon the data elements before the report is printed.

Link activity, 1250, to the SPS Processor generally handles this processing.

END OF REPT (EOR) PROCEDURES.

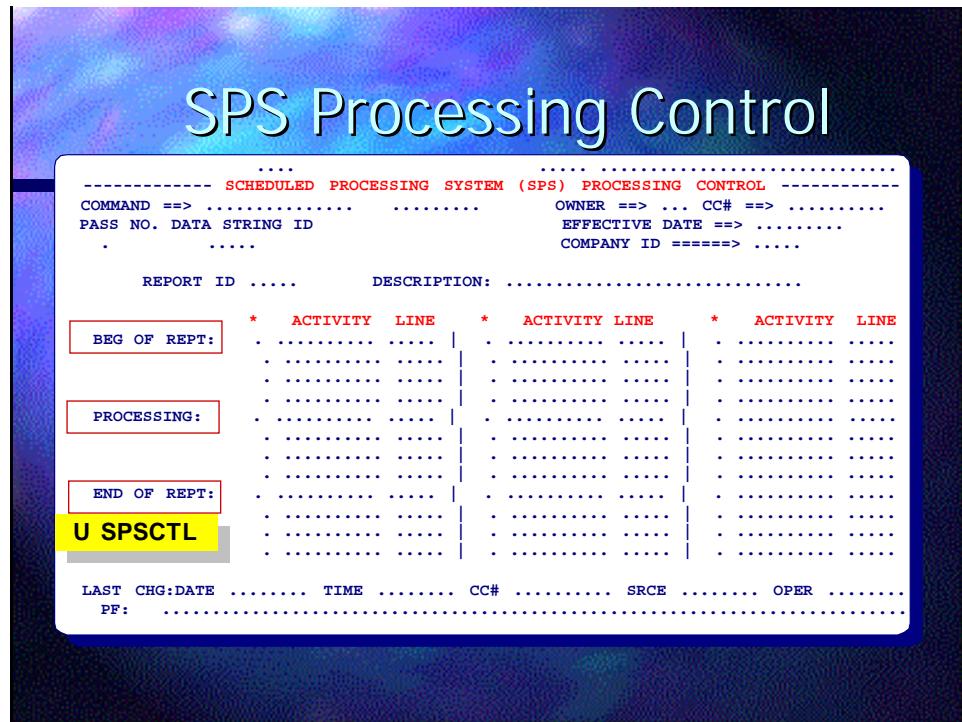

Activities issued once at the end of a report.

These activities generally include those that print company totals. All reports must issue activity 7628 last to release storage required by each report. Activity 7630 can be issued prior to activity 7628. It prints END-OF-REPORT.

SPS Processing Control Screen

The "Scheduled Processing System (SPS) Processing Control" screen can be displayed by using the direct prompt =SPSCTL from any Umbrella screen, or by entering U SPSCTL from a cleared screen. It can also be displayed from the "Scheduled Processing System (SPS) Reports Parameters" screen using the CTL command.

- Standard Command field. BYREPT, the Report Number is used as the search key. BYKEY, the Pass No and Data String ID is used as the search key.
- * (Action code) for each activity entry.
- Last change information.
- PF Keys documented on line 24.

Each task consists of an activity ID and a Line Definition Identifier. The activity is usually a link activity.

When the first Data String is read, the Processing Control Entry for the new Report is retrieved and its contents are tabled. The Activities associated with beginning of report are executed.

Umbrella Programming

SPS Processing Control Screen

Next the Activities associated with Processing are issued. They are executed consecutively for each Data String read. When the last Processing Activity has been processed, the next Data String Record is read. The loop continues until a Data String for a different Report, Company, or End of File condition is recognized.

When one of the above conditions arises, the End of Report section is executed. After the EOR activities have been executed and if EOF was not reached, the new control entry is retrieved and the process begins again.

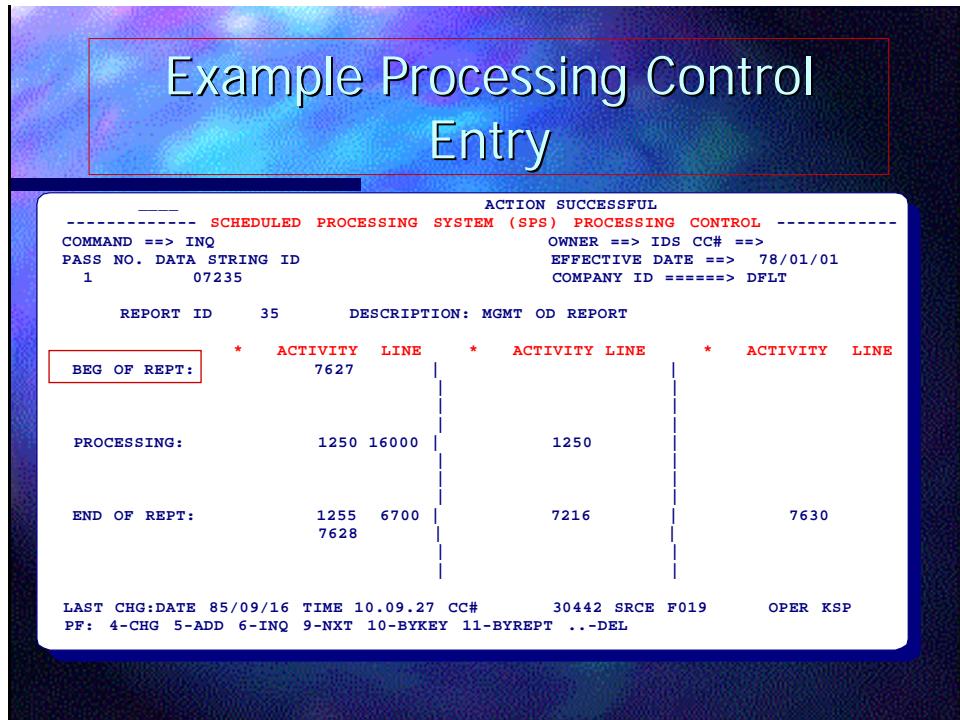

Notes:

Example Processing Control Entry

To display this item online:

1. Key U SPSCTL from a cleared screen and press ENTER.
2. Key INQ in the COMMAND field, 1 for the Pass Number, and 07235 for the Data String ID and press ENTER.

Notes:

Umbrella Programming

SPSCTL Beg of Rept Section

SPSCTL Beg of Rept Section

Beginning of Report work can include such items as printing banner or alignment pages or linking to a program to retrieve special data requirements for the report being generated. Most frequently, these activities are used to set up and initialize work fields or one time housekeeping functions.

In the example, there is only one activity ID in the Beginning of Report section. Activity ID 7627 is a link to the SPS Processor program 1850. Because the activity ID is greater than 1255, the SPS Processor Program builds a search key of 07627//spaces//000000//100. Report 07627, Mnemonic of Spaces, Line Definition zero, and Sequence Number 100. The Line Definition Commands are executed. The E (END) Line Definition Command causes control to return to the SPS Processor Program.

To view the SPS Code for 7627 online:

1. Key U SPS from a cleared screen and press ENTER.
2. Key INQ in the COMMAND field and Report ID 07627 and press ENTER.

The screenshot shows a terminal window with a blue gradient background. The title bar reads "SPSCTL BEG of REPT 7627". The window contains the following text:

SPSCTL Processing Section

The minimum processing needs of each data string are:

- (1) EXPLOSION** The restoration of data to application data groups from the SPS Data String, data group 3601.
- (2) OUTPUT** General calculations, editing and outputting data, checking for control breaks and page headings.

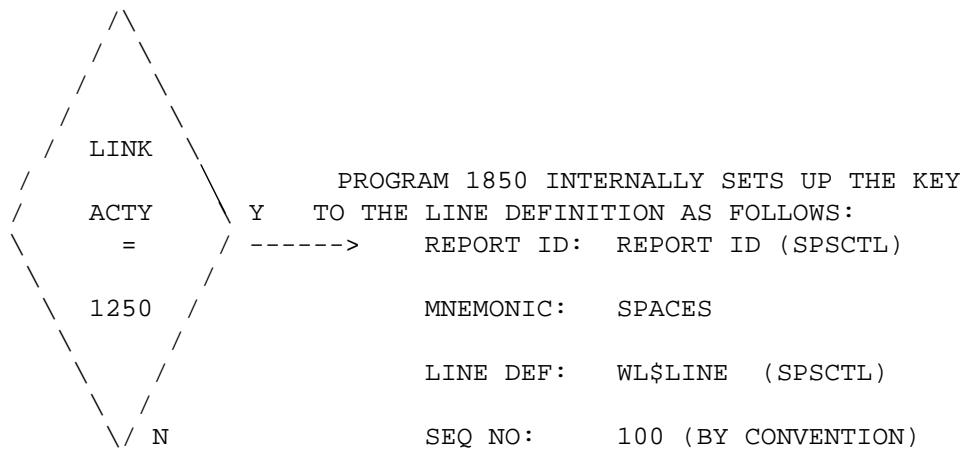

Notes:

Explosion Phase

The Explosion Phase involves the execution of an SPS Line Definition that moves data from a Data String Record (data group 3601) back to the original Data Groups from which they were Imploded. A Explosion is the reverse of an Implosion. The Explosion is executed for each Data String returned from the sort. The 1250 activity ID is coded on the SPS Processing Control Entry in the Processing Section with the Line Definition ID 16000.

Activity 1250 is specially defined to SPS to perform these two functions. It links to program 1850, the SPS Processor. The SPS Program builds the key to the SPSGEN data as follows:

There are three major requirements for Explosion Routines:

1. THE LINE DEFINITION MUST BE IN THE 16000 RANGE. IF ACTIVITY 1250 IS ISSUED, 16000 IS NORMALLY USED.
2. FORMAT DEFINITIONS USED ARE IN THE 16000 RANGE. ANY 'MOVE -' COMMANDS ARE FROM DATA GROUP 3601 RATHER THAN TO DATA GROUP 1031.
3. THE FIELDS MUST BE MOVED FROM DATA GROUP 3601 IN THE SAME ORDER AS THE IMPLOSION.

Note: At least the first Format Definition must be in the 16000 Range. PCS uses a large explosion SPS Line Definition 14800. The first Format Definition is 16010. It sets the pattern for the moves from data group 3601. Subsequent Format Definitions are 14001, 14002, 14004, and so on. These 14000 range numbers tie the implosion and explosion programs.

Umbrella Programming

SPSCTL Processing Section

Example Explosion Program

Line Definition 16000 for Report ID 35 contains the Explosion routine to move the data from the Data String Record back to the original data group(s). Field TLE50103, Sub Data String ID, is moved to WL\$LINE. This field was set to 1 in the Implosion routine.

Umbrella Programming

SPSCTL Processing Section

Output Phase

After the Explosion Routine has completed, control is returned to the SPS Processing Control Program to issue the next activity ID coded in the Processing Section of the SPSCTL entry for this report. Once again, activity ID 1250 is issued and control is passed to the SPS Processor program 1850.

This time, however, there is no Line Definition value specified next to the 1250 activity ID. The Report ID is still 00035 and the MNEMONIC is SPACES. Because there is no Line Definition value, program 1850 uses the value of field WL\$LINE as the Line Definition. During the Explosion Routine TLE50103 was moved to WL\$LINE. The value in WL\$LINE is 1. The SPSGEN data is searched to retrieve the Line Definition 000001. This Line Definition contains the code to format and print a detail line(s) of the report.

SPSCTL End of Rept Section

When all the Data Strings for Report 35 have been processed, the END of REPORT Activities are executed. These activities could invoke final branch totals, company totals, grand totals, printing a matrix, and Piggybacking routines. In this example, Activities 7216, 7630, and 7628 are executed. They are all links to program ID 1850.

07216 Piggyback implosion for reports distribution list.

07630 Causes 'END OF REPORT' to print.

07628 Causes SPS to release all internal data groups, incore tables, and address pointers.

Notes:

Umbrella Programming

Problem Specification—SPS Explosion and Output

Problem Specification—SPS Explosion and Output

This problem provides practice in the building of an Explosion routine and the creation of an output print routine using SPS. The result is a detail listing of the Employee Data Base. The print line layout can be of your own design.

1. Create the Processing Control Entry to process the Data Strings from your Implosion. The report will be for Pass Number 8. Remember the SPSCTL Key is the Pass Number//Data String ID.
2. Code the SPS Line Definition to Explode the data from the Data Strings you Imploded.
3. Code the SPS Line Definition to move the data to print and output the detail print line. Single space the report, and ignore page headings and control breaks.

Use Effective Date 780101, and Company DFLT.

DO NOT USE ANY FORMAT DEFINITION COMMAND OR LINE DEFINITION COMMAND THAT HAS NOT BEEN DISCUSSED IN CLASS.

Worksheets for the exercise are provided after the JCL listing.

JCL has been set up for testing. No modifications to the JCL are necessary. Following is a listing of the JCL

Notes:

Processing Control Entry Worksheet

Notes:

Summary

Summary

- ✓ 1698 controls production of reports
- ✓ SORT, EXPLOSION, OUTPUT = phases or Reports Production
- ✓ 16400 is default Sort Activity
 - ✓ Begins at position 18 and sorts for 1 byte
 - ✓ Goes to position 9 and sorts for 9 bytes of Hogan Key and 30 bytes of user defined fields
- ✓ Each report has Processing Control Entry
- ✓ Activities divided into 3 sections

Summary

- ✓ BEGINNING of REPORT activities = 7627 and 17627
- ✓ Activity 1250 issued twice for each data string
- ✓ Activity 7628 issued as END of REPORT activity
- ✓ 16000 range builds line definition and format definition
- ✓ Reports produced as separate JOB STEPS or JOBS
- ✓ Sub data string field provides flexibility

Umbrella Programming

Summary

- The SPS Processing Control program 1698 controls the production of reports.
- The three phases of Reports Production are SORT, EXPLOSION, and OUTPUT.
- The default Sort Activity is 16400. To override the sort, place the override Sort activity ID in Field 6 of data group 1009.
- The 16400 sort begins at position 18 and sorts for 1 byte language code, then at position 9 and sorts for 9 bytes of the Hogan Key and then 30 bytes of the user defined fields.
- Each report has a Processing Control Entry. The entry contains the activities that are issued to produce the report. The entry is keyed by Pass Number and Data String ID.
- The Activities are divided into 3 sections: BEGINNING of REPORT, EACH DATA STRING, and END of REPORT.
- The two standard BEGINNING of REPORT activities are 7627 and 17627.
- Activity 1250 is generally issued twice for each Data String. The first time for the explosion; the second time to format and output the report.
- When activity 1250 is issued, the SPS Processor identifies the SPS Program to invoke by the Report ID, Mnemonic of spaces, and Line Definition equal to the value of WL\$LINE. The WL\$LINE value can be entered on the Processing Control Entry or set prior to the issuance of the 1250 activity.
- Activity 7628 must be issued as the last END of REPORT activity.
- The Line Definition and Format Definitions for Explosion routines must be built using the 16000 range.
- SPS Reports are produced as separate JOB STEPS or JOBS.
- The Sub Data String field in the Hogan key provides flexibility for processing SPS Data Strings.

Heading Processing

Page Overflow

Page overflow conditions are controlled in an SPS Line Definition through the use of the D Line Definition Command. This Command decrements a value from an internal line counter, whose default value is 56 lines per page. The SPS Report code issues the D Command and an associated value to reflect the number of lines that have been printed.

When the line counter becomes negative, program 1850 internally issues Link activity 1251. This activity links back to program 1850 and signals that a new page is needed.

In the following SPS detail line print program, the first Line Definition command is a D 2.

The image shows a screenshot of an SPS Report Code window. The title bar reads "SPS Report Code". The main area displays a report with several sections of text. A yellow callout box labeled "Page Overflow" points to a line of text in the middle of the report. The report includes sections for SCHEDULED PROCESSING SYSTEM parameters, a report code section, and a detailed instruction section. The instruction section contains numerous MOVE commands and a comment section. The bottom of the report shows system status information.

SCHEDULED PROCESSING SYSTEM			ACTION SUCCESSFUL	
COMMAND ==> SF	(SPS) REPORT CODE		OWNER ==> IDS CC# ==>	
LANG RPT ID MNEMONIC LINE DEF SEQ			EFFECTIVE DATE ==> 78/01/01

D Line Definition Command

This command is used to control vertical spacing on a report. When SPS executes this command, it performs two functions. The first is to subtract the value of the operand from the internal line counter. The second is to determine if the internal counter is negative.

EXAMPLE: D 00002

The value of 2 is subtracted from the internal line counter. If the result is less than zero, SPS invokes activity 1251 to program 1850. If the result is not negative, processing continues with the next instruction.

Decision Point for Program 1850

Notes:

Umbrella Programming

Heading Processing

Page Overflow Line Definitions

Page headings are produced by SPS Line Definitions. Their Report ID is the same as the report being produced with the mnemonic of HEAD. For example, page heading routines for Report ID 35 would be identified 00035 HEAD.

When SPS automatically invokes these routines, the following numbering standards must be followed. The Line Definition containing the new page processing code must be 1000. Format Definitions within Line Definition 1000 are numbered 1010, 1020, and 1030. Typical processing within these routines includes the following:

- Skipping to channel one, top of page.
- Formatting the report title or heading.
- Incrementing and formatting the page number. PAGENO is a field for accumulating the number of pages.
- Formatting the column headings.
- Decrementing the internal line counter for the number of lines representing the entire page heading.

Notes:

Example Heading Program

In the HEAD routine the report title and column heading text is formatted and printed.

Heading Program Example

```
----- SCHEDULED PROCESSING SYSTEM -----  
COMMAND ==> SF (SPS) REPORT CODE -----  
LANG RPT ID MNEMONIC LINE DEF SEQ OWNER ==> IDS CC# ==>

Umbrella Programming

Heading Processing

Generating the Heading

The following logic illustrates the processing flow of SPS when the decrement Line Definition Command is executed.

Note: The generation of a new report resets the internal line counter to zero. The first D Command causes the line counter to be negative. When the Line Counter is negative, the heading routine is executed and the heading for the first page of the report is printed.

1. IS THIS A NEW REPORT?

YES -

RESET THE LINE COUNTER TO 0

2. SUBTRACT THE VALUE IN THE D COMMAND FROM THE LINE COUNTER.

3. IS THE LINE COUNTER NEGATIVE?

YES -

RESET THE LINE COUNTER TO 56 OR LINES PER PAGE ON REPORT PARAMETERS SCREEN

EXECUTE: REPORT ID = REPORT ID (SPSCTL)

MNEMONIC = HEAD

LINE DEFN = 1000

SEQUENCE = 100 (BY CONVENTION)

GO TO STEP 2

4. CONTINUE PROCESSING.

Special Values of the D Command

The D Line Definition Command may be used for special processing.

D 00000 Reinitializes the internal counter to zero.

D X Where X is greater than the number of lines per page established for the report. Executing this instruction causes page overflow processing routines to be invoked. A common example of this variation of the D Command is D 99.

D 33000 Tests the internal Line Counter for a zero or negative value. If the condition is true, SPS automatically invokes the page header routine for the report. Otherwise, it executes the next sequential instruction.

Note: The value of 33000 is not subtracted from the Line Counter.

DEC Format Definition Command

Another version of decrement exists as a Format Definition Command.

```
DEC (LINECOUNT) (BY) N
```

This instruction causes the current page Line Count to be decremented by the value of N. If the decrement results in a negative line count, the internal Line Counter is reinitialized to zero. The Line Counter, however, is not tested for a negative value. Regardless of the result of the decrement, page overflow processing routines are not automatically invoked.

The DEC Command should be used in conjunction with the D 33000 Command. The D 33000 Command forces the test of the Line Counter and invokes the heading routine if the internal Line Counter is negative or zero.

Notes:

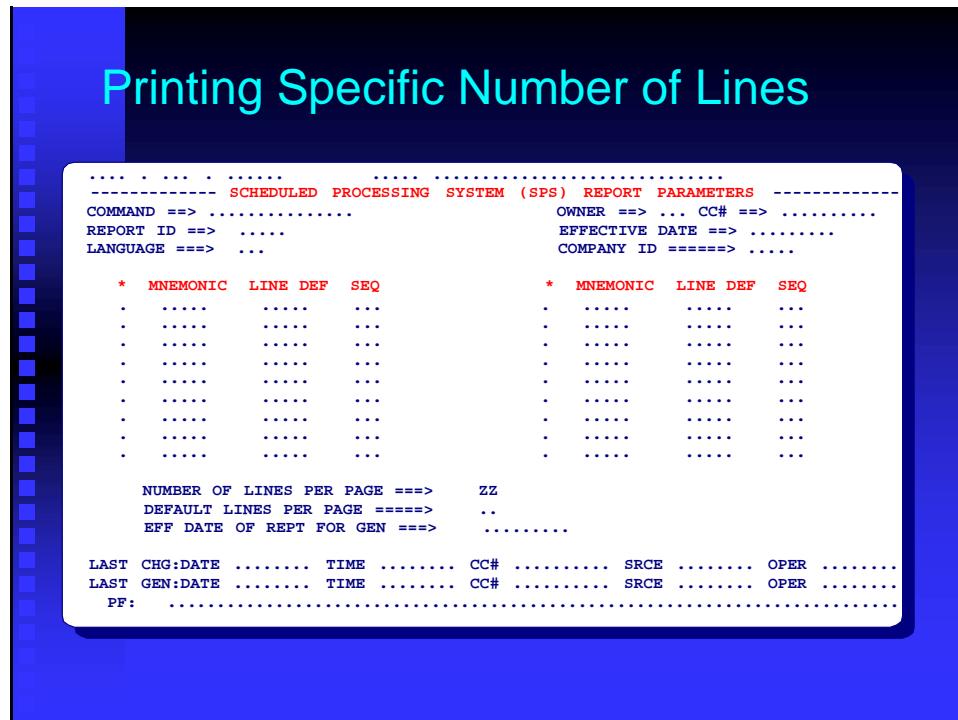

Umbrella Programming

Heading Processing

Printing a Specific Number of Lines

Overriding the default number of lines per page for a report requires modification to the "Scheduled Processing System (SPS) Report Parameters" screen. Note the screen below and the field NUMBER OF LINES PER PAGE.

When a change is made to the number of lines per page, the report must be GENed.

Notes:

Problem Specifications—SPS Head

Each group is to design appropriate page and column headings for the report being produced. This task involves the following:

1. Using the correct Line Definition Command to trigger SPS to issue activity 1251.
2. Add an SPS Line Definition to handle new page processing requirements. Use an Effective Date 780101 and Company DFLT.
3. The report title, include your Group Name and the page number, should print at the top each page. Be sure the first detail line is not printing prior to the first heading for your report.
4. Column heading text for the detail employee data should appear double spaced after the heading.

Notes:

Summary

Summary

- D Line Definition Command controls page overflow
- Negative internal line counter backs itself with Link activity 1251
- Heading Routines coded as separate SPS Line Definitions
- Special values for D
 - D 0
 - D X where X is a number greater than *lines per page*
 - D 33000

Summary

- Lines per page set on SPS Report Parameters screen
- Internal line counter at 0 for new report - 56 otherwise
- Change in number of lines = reGEN of report

Umbrella Programming

Problem Specifications—SPS Head

- Page overflow is controlled by the D Line Definition Command. This command decreases an internal line counter and tests for a negative value.
- When the internal line counter is negative, the SPS Processor links back to itself with the Link activity 1251. This value flags the invocation of a Heading Routine.
- Heading Routines are coded as separate SPS Line Definitions with a Report ID for the report being produced, mnemonic of HEAD, and Line Definition of 1000.
- The three special values for D are:
 - D 0
 - D X where X is a number greater than lines per page
 - D 33000
- The "Scheduled Processing System (SPS) Report Parameters" screen has a field where the number of lines per page is set.
- The internal line counter is set to 0 at the beginning of a new report. Otherwise, it is set to 56 or the number of lines per page on the "Scheduled Processing System (SPS) Report Parameters" screen.
- If the number of lines per page changes, the report must be reGENed.

29-14

SPS Heading Processing

SPS Break Processing

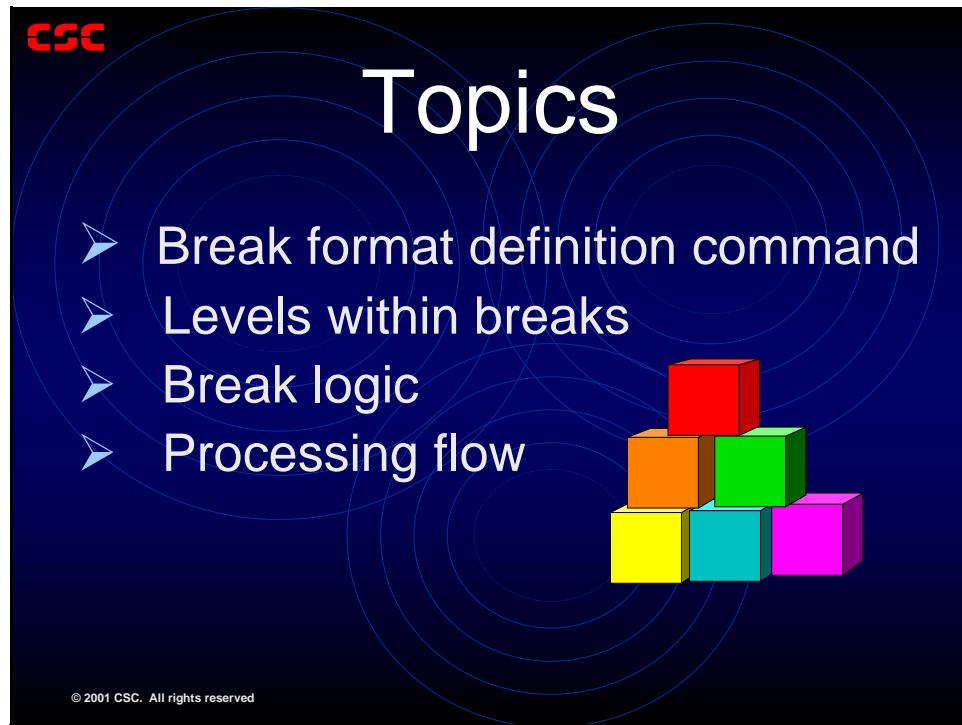

30

Notes:

Topics

Notes:

Objectives

Objectives

- ✓ Explain break logic under SPS
- ✓ Use break format definition command
- ✓ Describe levels within breaks
- ✓ Code SPS break routines online

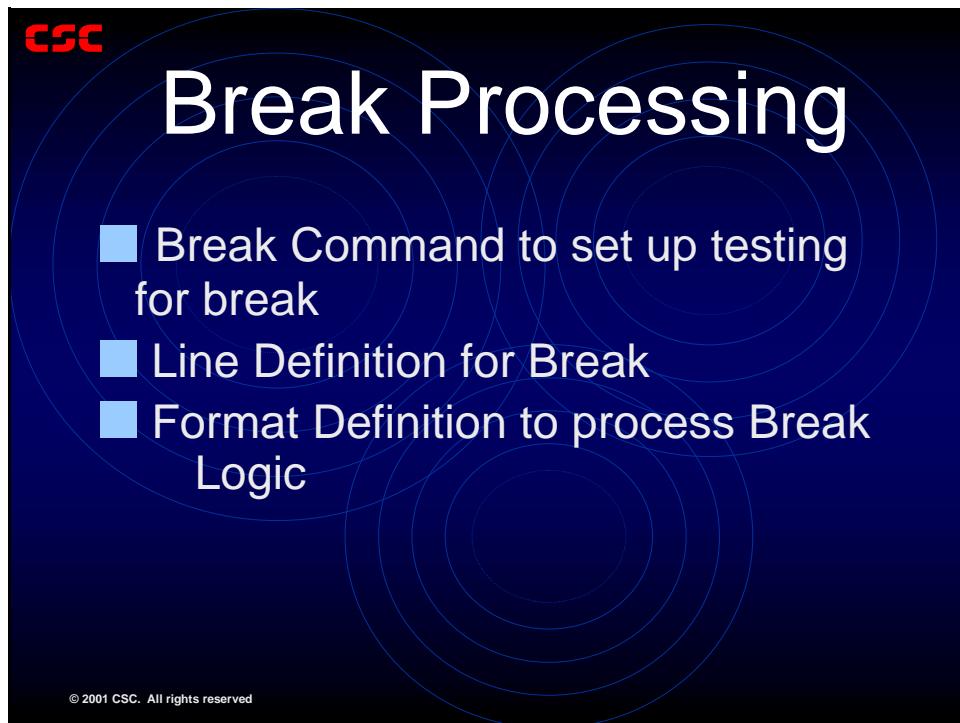

© 2001 CSC. All rights reserved

Notes:

SPS Break Processing

There are three parts to Break Processing:

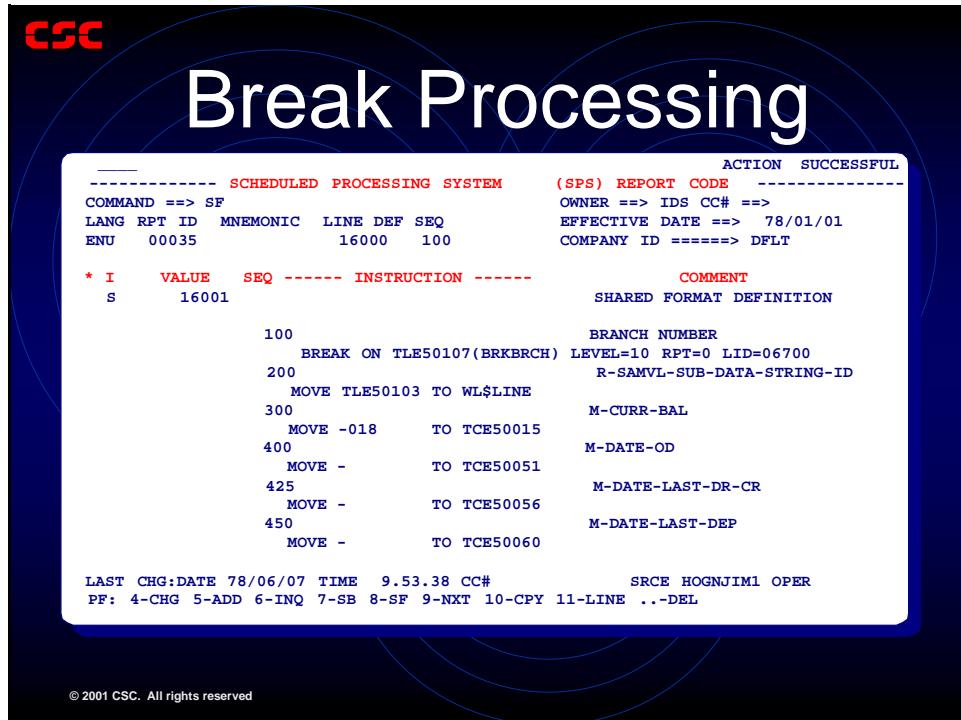

Break processing is controlled in an SPS Program by using the Format Definition Command BREAK. This Command prompts SPS to compare a current value in a field to a previous value stored in a save area. User-coded break processing routines are automatically executed when the current value is not equal to the previous value.

The placement of the Break Command within the logic depends on when the data is available. In the example the Break Command is coded at the beginning of the Explosion routine. The data field TLE50107 is BRANCH NUMBER and is defined in the HOGAN KEY portion of the Data String. If the break data field was part of the USER DATA portion of the Data String, the Break Command would have to be coded at the end of the Explosion Routine. The Break Command can also be coded at the beginning of the Detail print routine.

Grand totals are not controlled by the BREAK Command. These totals would be invoked from the SPS Processing Control Entry specified in the End of Report Section.

Notes:

Umbrella Programming

SPS Break Processing

BREAK Format Definition Command

```
BREAK ON INPUT-ELEMENT(OUTPUT-ELEMENT) LEVEL=NNNNN  
LID=NNNNN RPT=NNNNN
```

Where:

INPUT-ELEMENT Is the current value.

OUTPUT-ELEMENT Is the previous value.

LEVEL=NNNNN Used for documentation only unless concatenated elements are required.

LID=NNNNN Line definition containing the break processing logic to be executed if a break occurs.

RPT=NNNNN If the value of NNNNN is 0, the report ID of the current report is combined with the mnemonic break to identify the break routine.

If the value is not 0, the number specified becomes the report ID.

Notes:

Examples of Three Level Breaks

Example 1

```
S nnn
 100
    BREAK ON BRANCH  LEVEL=01 LID=6900 RPT=0
 200
    BREAK ON PRODUCT LEVEL=02 LID=6800 RPT=0
 300
    BREAK ON SUBPROD LEVEL=03 LID=6700 RPT=0
```

These three Break Commands are coded from major to minor levels.

Note: There are no imbedded instructions within these commands. If a control break occurs at a higher level, then subsequent breaks at a minor level(s) are forced by SPS.

When the Break Command is executed and the current value is not equal to the previous value, SPS accesses the Line Definition using the Report ID and mnemonic BREAK as the key.

By convention, Line Definitions containing break processing logic are numbered in the 6000 range. Format Definitions follow the pattern established by the Line Definition. Line Definition 6900 would contain Format Definitions numbered 6910, 6920, and 6930.

Example 2

```
S nnn
 100
    BREAK ON BRANCH(XBRANCH)      LEVEL=01 LID=6900 RPT=0
 200
    BREAK ON PRODUCT(XPRODUCT)   LEVEL=02 LID=6800 RPT=0
 300
    BREAK ON SUBPROD(XSUBPROD)  LEVEL=03 LID=6700 RPT=0
```

The previous value (OUTPUT-ELEMENT) is provided to the user if a save area is referenced in the break statement itself. Both the INPUT-ELEMENT and OUTPUT-ELEMENT must be defined on the Data Dictionary through normal data group maintenance.

First time logic in SPS moves the current value to the save area, and no break checking occurs.

Umbrella Programming

SPS Break Processing

Example 3

```
S nnn
 100
      BREAK ON BRANCH LEVEL=01 LID=6900 RPT=0
 200
      BREAK ON PRODUCT LEVEL=02 LID=6800 RPT=0
 300
      BREAK ON SUBPROD LEVEL=03 LID=6700 RPT=0
 400
      BREAK ON OFFICER LEVEL=03 LID=6700 RPT=0
```

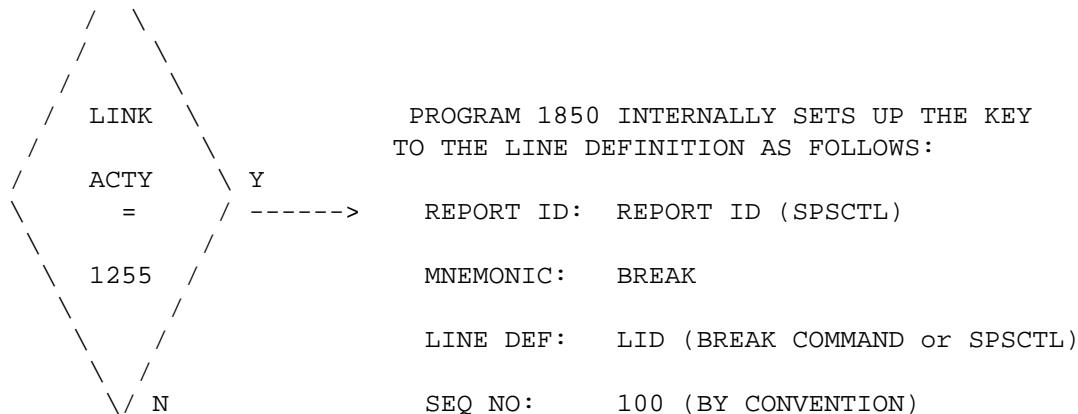

Multiple elements may be concatenated into one level control when the Level Number, Line Definition, and Report Number are the same. This example illustrates the two break statements to code when a change in either the subproduct or officer code is detected by SPS. In each case, Line Definition 6700 is executed.

Notes:

Break Logic

Break routines handle special processing requirements when changes in certain data elements occur. The most common special processing is subtotals and grand totals. For example, a new branch number may indicate a need to print summary totals for the prior branch. In addition, branch level totals could be rolled into company level accumulators. When a break is sensed by the SPS Processor, Link activity ID 1255 is issued to program ID 1850.

Notes:

Umbrella Programming

SPS Break Processing

Example Break Program

The Format Definitions within the Break Line Definition follow the numbering convention of the Line Definition plus 10. The first Format Definition is 6710, the second would be 6720. The logic within the Break Line Definition would be to format and print totals, roll the totals to a higher level, and clear the current level totals.

Example Break Program

```
ACTION SUCCESSFUL
----- SCHEDULED PROCESSING SYSTEM (SPS) REPORT CODE -----
COMMAND ==> SF OWNER ==> IDS CC# ==>
LANG RPT ID MNEMONIC LINE DEF SEQ EFFECTIVE DATE ==> 78/01/01

Notes:

Umbrella Programming

SPS Break Processing

Printing the Last Set of Totals and Grand Totals

The BREAK Line Definition Command will drive the your process to print the Break routine when there is a change in the data value(s) specified in the Break Command. However, when there is a change in the Report ID or end of file on the SPS Data String file is detected, SPS starts processing the End of Report activities. This is where you need to specify the Break routine(s) to print the last total set and grand totals. The 1255 activity ID with the corresponding Line ID causes the SPS Break routines to be processed. The order of the 1255/Line ID must be specified in the order you wish the totals to be printed.

Notes:

Problem Specifications—SPS Break

The report so far contains details and headers. In the exercise code needs to be added to your SPS report to test, accumulate and print department totals. This task involves the following:

1. Accumulate the detail amount and quantity fields. The /nn and \$nn fields defined in the SET Format Definition Command can be used.
2. Add the BREAK Format Definition Command to print department totals when a break on department number is detected. One of the WRK. fields can be used to store the value of the department.
3. The printing of the totals should be two space lines after the last detail line for the department being totaled. The break should include the department number, total number of employees, total current earnings and total year-to-date earnings for each department. The totals lines should appear as follows:

DEPARTMENT XXX TOTALS - EMPLOYEES	ZZZZ9
- CUR EARNINGS	\$\$\$, \$\$\$. \$\$9.99
- YTD EARNINGS	\$\$\$, \$\$\$. \$\$9.99

4. Start the next department detail on a new page with a page number of 1.
5. A modification to your SPS Processing Control Entry (SPSCTL) must be made in order to print the last department total at the End of the Report.

Notes:

Summary

The slide features a dark blue background with concentric circles. In the top left corner is the CSC logo, and in the top right is a graphic of interlocking puzzle pieces in various colors (green, pink, yellow, blue). The word "Summary" is written in large white letters in the center. A vertical list of seven items, each preceded by a checkmark, is displayed in the middle-right area. At the bottom left is a small copyright notice, and at the bottom right is a small icon labeled "Sps Appendix".

- ✓ SPS handles processing needs with changes of categories
- ✓ SPS breaks on the field(s)
- ✓ Separate SPS Programs for printing
- ✓ Multiple levels of breaks can be processed
- ✓ Break Command can save previous value
- ✓ Invoking Break routines for final categories and grand totals handled in End of Report area

© 2001 CSC. All rights reserved

Sps Appendix

- SPS handles processing needs when changes in categories of data occur through break processing.
- SPS breaks on the field(s) through the processing of the BREAK Format Definition Command.
- There are separate SPS Programs to print out the break information for each break field and the grand total.
- Multiple levels of breaks can be processed. Multiple BREAK Commands are required. They are listed from major to minor levels. Multiple Break routines are needed.
- The BREAK Command can save the previous value for the data.
- Invoking the Break routines for the final categories and grand totals is handled in the End of Report area of the SPS Processing Control Entry.

Summary—Product Usage

A

This summary provides a quick reference for individual product standards.

The following sections identify, by system, the Umbrella components used by delivered products.

Budget and Planning System (BPS) Component Identification

The following are the components used by the Budget and Planning System.

BPS—Budget and Planning System (BPS)

Component Identifier	Identification Range
Family	BPS
Application	270
Activities	270000–279999
ASSEMBLER Macros	B270000E–B279999E
COBOL Copybooks—Data Division	B270000D–B279999D
COBOL Copybooks—Procedure Division	None
Condition Codes	Application Code of 270, 1–49999, 60000–65535
Data Elements	None
Data Groups	270000–279999
Maps	None
PCDs/Formats	None
Program Source	B270000–B279999
Programs	270000–279999
Reports	None
Transactions—CICS/IMS	None

Consumer and Merchant Servicing System (CAMS) Component Identification

The following are the components used by the Consumer and Merchant Servicing System.

TCS—Consumer and Merchant Servicing System

Component Identifier	Identification Range
Family	TCS
Application	90
Activities	45000–45999, 100000–119999
ASSEMBLER Macros	Q00000E–Q19999E
COBOL Copybooks—Data Division	Q00000D–Q19999D
COBOL Copybooks—Procedure Division	Not used
Condition Codes	Application Code of 90, 1–49999, 60000–65535
Data Elements	Q00000AA–Q9999999
Data Groups	100000–119999
Maps	Q00000M–Q19999M
PCDs/Formats	106000–106999
Program Source	Q00000–Q19999
Programs	100000–119999
Reports	QR15000–QR15999
Transactions—CICS/IMS	TCS, TCSC, TINT

Credit Risk System (CRS) Component Identification

The following are the components used by the Credit Risk System.

RAS—Credit Risk System (CRS)

Component Identifier	Identification Range
Family	RAS
Application	250
Activities	250000–259999
ASSEMBLER Macros	R250000E–R259999E
COBOL Copybooks—Data Division	R250000D–R259999D
COBOL Copybooks—Procedure Division	Not used
Condition Codes	Application Code of 250, 1–49999, 60000–65535
Data Elements	None
Data Groups	250000–259999
Maps	None
PCDs/Formats	None
Program Source	R250000–R259999
Programs	250000–259999
Reports	None
Transactions—CICS/IMS	None

Earnings Analysis System (EAS) Component Identification

The following are the components used by the Earnings Analysis System.

EAS—Earnings Analysis System

Component Identifier	Identification Range
Family	EAS
Application	24, 40
Activities	240000–241999
ASSEMBLER Macros	Y40000E–Y41999E
COBOL Copybooks—Data Division	Y40000D–Y41999D
COBOL Copybooks—Procedure Division	Not used
Condition Codes	Application code of 24, 1–49999, 60000–65535
Data Elements	Y41000AA–Y419999
Data Groups	240000–241999
Maps	Y40000M–Y41999M
PCDs/Formats	None
Program Source	Y40000–Y41999
Programs	240000–241999
Reports	YR24000–Y241999
Transactions—CICS/IMS	YAAA–Y999

Financial Information System (FIS) Component Identification

The following are the components used by the Financial Information System.

FIS—Financial Information System

Component Identifier	Identification Range
Family	FIS
Application	36
Activities	36100–36999, 600000–699999
ASSEMBLER Macros	F60000E–F69999E
COBOL Copybooks—Data Division	F60000D–F69999D
COBOL Copybooks—Procedure Division	F60000P–F69999P
Data Elements	FAA00001–FZZ99999
Data Groups	600000–699999
Maps	F60000M–F69999M
PCDs/Formats	600000–699999
Program Source	F36500–F36999, F600000–F699999
Programs	36500–36999, 600000–699999
Reports	FR0000–FR9999
Transactions—CICS/IMS	FAAA–F999

Financial Support System (FSS) Component Identification

The following are the components used by the Financial Support System and its subsystems.

CDS—Cycle Data System

Component Identifier	Identification Range
Family	FSS
Ownership	CDS
Application	51
Activities	8800–8950
ASSEMBLER Macros	I51000E–I51999E
COBOL Copybooks—Data Division	I51000D–I51999D
COBOL Copybooks—Procedure Division	I51000D–I51999D
Data Elements	TBE51000–TBE51999
Data Groups	3602, 8800–8950
Maps	I51100M–I51999M
PCDs/Formats	8800–8899
Program Source	I51000–I51999
Programs	8800–8950
Reports	SR0000–SR9999
Transactions—CICS/IMS	KAAA–K999

Umbrella Programming

Financial Support System (FSS) Component Identification

CWS—Check Writing System

Component Identifier	Identification Range
Family	FSS
Ownership	CWS
Application	58
Activities	5900–5999
ASSEMBLER Macros	I58000E–I58999E
COBOL Copybooks—Data Division	I58000D–I58999D
COBOL Copybooks—Procedure Division	I58000P–I58999P
Data Elements	ICW000A1–ICW99999

Common SPS Errors

As in any system, there are some errors that will occur frequently. The purpose of this topic is to list some frequent mistakes and their possible causes.

1. The number one error associated with SPS is caused by failure to GEN a report after a change is made. The results of this error are unpredictable because the code that can be viewed online is not that which is being executed from the SPSGEN File. REMEMBER TO GEN!!!!
2. The best debugging technique for SPS is to check all pieces of the SPS code that are generating a report. Because many rules are unbending, you have to follow them. Check all the details.

3. S0C7 ERRORS

- Check that the implosion and explosion fields are in the same order.
- Check for typing errors on a Data Element Name. You may have typed the name of a character field for a numeric one.
- Check for uninitialized fields. For example, the work fields, such as, W01, have to be initialized in simple SPS Reports.

4. BLANK REPORT

- Be sure you did not leave the carriage control byte set to a before printing setting.
- Check that you included the PRINT Command or its equivalent.

5. S001 OR S002

- This error indicates an empty data set.
- It can occur when a Data Base is not read correctly.
- It can occur when a Data String is not written correctly.
- It can occur when a write activity is incorrectly included in an explosion.

6. UNPREDICTABLE RESULTS

- An activity that should link to the SPS Processor Program, Program ID 1850, links to another program.
- Effective dates for pieces of the report are mixed.
- The E Command is left off the Line Definition.
- TLE50107 is not cleared or set in the implosion.

Umbrella Programming

Common SPS Errors

7. TRUNCATED RESULT

- The output length is too short.
- You forgot to count the commas, periods, and negative sign when calculating the length of the edited data.

8. REFERENCES TO AN UNEXPECTED REPORT ID

- Check the Report ID on the Processing Control Entry (SPSCTL).
- This field determines which Report ID is executed.

9. REFERENCES TO PAGE OVERFLOW

- Page overflow refers to the lines per page entry.
- When lines per page field is set on the Report Parameters screen, PCD 2301 entries are added. There should be entries for each print detail and break routine. Verify that all the entries exist.
- In addition, the HEADINGS ID field on the PCD 2300 entry for each detail print and break routine should be set to 1000.

10. 'P02' NOT AN ELEMENT ID

- Previous versions of SPS allowed position references such as P08, P01, and P02. They are no longer allowed. The editor attempts to translate them into an Element Name and fails.
- In GENing an SPS Report, you may discover some entries with these references. You need to delete them from PCD 2302 or correct them to the -008 form.

Notes:

SPS Class Quick Reference

Overview

1. All symbolic Data Element Definitions required by SPS must be established in the Data Dictionary. Data Elements are defined as fields in Data Groups.
2. Line Definitions are executable Commands that correspond to the main line logic of an SPS Program. They are stored on CDMF format 2300.
3. Format Definitions correspond to subroutines performed from the main line logic of an SPS Program. They are stored on CDMF format 2302. Each Command of the SPS Format Definition is an individual item on CDMF format 2302.

Implosion

- MOVE KEY DATA TO DATA STRING.
 - MOVE REPORT DETAIL TO DATA STRING FROM DATA GROUP(S).
 - WRITE DATA STRING.
1. A Line Definition of 0 must be used for an SPS Implosion Program.
 2. SPS Format Definitions of 15000 through 15999 must be used for Implosion Code.
 3. The application program must use an activity number greater than 1255 to link to SPS to initiate an implosion. SPS accesses the SPSGEN File with the activity number as the Report ID and automatically executes Line Definition 0.
 4. The link activity number usually becomes the Data String ID in the implosion. This is the number that is moved to TLE50102 (R-SAMVL-STRING-ID).

Note: This is the recommended Hogan convention only. Some of our delivered applications do not conform to this convention. There are instances when processing requirements require deviation from this convention.

In summary, in order to initiate an implosion, the following numeric values match:

- THE ACTIVITY NUMBER THAT LINKS TO SPS
- THE REPORT ID FOR THE SPS PROGRAM (LINE DEFN = 0)
- THE DATA STRING ID (TLE50102)

Processing Control Entry

1. The Processing Control Entry controls report production through SPS.
2. The activity numbers on the entry indicate the Beginning-of-Report (BOR) procedures, Processing routines for each Data String (EDS), and End-of-Report (EOR) activities.

Umbrella Programming

Common SPS Errors

3. The entry is identified by the Pass Number and the Data String ID from the implosion phase.
4. The Report ID field on the entry becomes the Report ID for all Line and Format Definitions for producing the report.

Explosion

- READ DATA STRING.
 - MOVE REPORT DETAIL FROM DATA STRING TO DATA GROUP(S).
1. A Line Definition in the 16000 range is required.
 2. Format Definitions in the 16000 range are required.
 3. Activity 1250 is used to invoke explosions.
 4. Data group 3601 is used to write and read SPS Data Strings. It is a variable-length, variable-format record.

Output

- MOVE REPORT DETAIL TO OUTPUT PRINT AREA.
 - PRINT REPORT LINE.
 - EXECUTE HEADING LOGIC.
 - EXECUTE SUBTOTALS AND TOTALS LOGIC WHEN NECESSARY.
1. Data group 1031 is used to contain the report output area (print line) and output control data.
 2. Activity 1250 is used to invoke the detail print routines.

Special Activities in SPS

1250	Requires Report ID plus spaces. If a Line Definition is coded with the activity number on the Processing Control Entry, it is executed. Otherwise, the contents of WL\$LINE represent the Line Definition to be executed.
1251	Requires Report ID plus HEAD.
1255	Requires Report ID plus BREAK.
7627	Beginning-of Report procedures (housekeeping).
17627	Beginning-of Report procedures (housekeeping—ILP).
7628	End-of Report cleanup procedures.
7630	Causes END OF REPORT to be printed.

Headings

1. If the internal Line Counter is less than 0, heading routines are invoked by SPS. The counter is decremented by the D Line Definition Command or the DEC Format Definition Command.
2. Activity 1251 is internally issued by program 1850 to transfer control to the heading routine. The activity can also be issued within an SPS Program or on the Processing Control Entry to force a new page and heading.
3. Line Definition 1000 and Format Definitions in the 1000 range are used. For example, Line Definition 1000 executes SPS Format Definitions 1010, 1020, 1030.

Breaks

1. BREAK Commands allow control totals to be taken when the present control is not equal to the previous control.
2. Activity 1255 invokes breaks.
3. Hogan conventions are to use Line Definitions 6100, 6200, 6300, with Format Definitions 6110, 6210, 6310.

Common SPS Errors

SPS Summary

Implosions

```
LINK ACTIVITY (> 1255)      =  DATA STRING ID  
  
LINE DEFINITIONS REPORT ID   =  DATA STRING ID  
                           LINE DEFN   =  0  
  
FORMAT DEFINITIONS REPORT ID =  DATA STRING ID  
                           FORMAT DEFN =  15000 - 15999
```

Explosions

```
PROCESSING CONTROL ENTRY     =  PASS #//DATA STRING ID  
  
LINE DEFINITION ID          =  REPORT ID  
                           LINE DEFN   =  16000 - 16999  
  
FORMAT DEFINITIONS ID       =  REPORT ID  
                           FORMAT DEFN =  16000 - 16999
```

Output

```
PROCESSING CONTROL ENTRY     =  PASS #//DATA STRING ID  
  
LINE DEFINITION ID          =  REPORT ID  
                           LINE DEFN   =  ANY NUMBER EXCEPT 0 AND 16000 - 16999  
  
FORMAT DEFINITIONS ID       =  REPORT ID  
                           FORMAT DEFN =  ANY NUMBER EXCEPT 15000 - 16999
```

Headings

```
LINE DEFINITION ID          =  REPORT ID//HEAD  
                           LINE DEFN   =  1000  
  
FORMAT DEFINITION ID        =  REPORT ID//HEAD  
                           FORMAT DEFN =  1010, 1020, 1030... (BY CONVENTION)
```

Breaks

```
LINE DEFINITION ID          =  REPORT ID//BREAK  
                           LINE DEFN   =  6100, 6200, 6300... (BY CONVENTION)  
  
FORMAT DEFINITION ID        =  REPORT ID//BREAK  
                           FORMAT DEFN =  6110, 6120, 6130... (BY CONVENTION)  
                           6210, 6220, 6230 . . .  
                           6310, 6320, 6330 . . .
```

SPS Report Creation

- I M P L O S I O N
 - 1.On the “Scheduled Processing System (SPS) Report Parameters” screen, add the Implosion Program. Verify that you have Report ID greater than 1255, Mnemonic of SPACES, a Line ID of 0, Sequence 100 (by convention).
 - 2.On the SPS Report Code screen, code the Implosion. Use Format Definitions in the 15000 range. Use the SPS Format Definition screen to enter the Format Definition Commands.
 - 3.GEN.
- P R O C E S S I N G C O N T R O L E N T R Y
 - 1.On the SPS Processing Control screen, add the report for Pass Number (1 digit) and Data String ID (from the implosion).
 - 2.Verify the following data:
 - Report ID—number to be used for SPS Explosion and Output phases.
 - Activity(ies) to be performed at Beginning of Report. Activities 7627 and 17627 are delivered housekeeping activities.
 - Activities to be performed each time a Data String Record is read. This includes 1250, executing Line Definition 16000 and another activity 1250. The second Line Definition can be specified on the entry or, if blank, is derived from WL\$LINE.
 - Activities to be performed at the End of the Report. These include activity 1255 to execute final break routines and activities 7630 and 7628.
- E X P L O S I O N A N D O U T P U T
 - 1.CODE EXPLOSION
 - On the “Scheduled Processing System (SPS) Report Parameters” screen, add the Explosion Program. Verify that you have a Mnemonic of SPACES, a Line Definition of 16000, Sequence of 100 (by convention).
 - On the SPS Report Code screen, code the Explosion. Use Format Definitions in the 16000 range. Use the SPS Format Definition screen to enter the Format Definition Commands.
 - GEN.

Umbrella Programming

Common SPS Errors

2.CODE OUTPUT

- On the “Scheduled Processing System (SPS) Report Parameters” screen, add the Output Program. Verify that you have a Mnemonic of SPACES, a Line Definition other than 0 or 16000, Sequence of 100 (by convention).
- On the SPS Report Code screen, code the Output. Use Format Definitions in any range except 15000-16999. Use the SPS Format Definition screen to enter the Format Definition Commands.
- GEN.

3.CODE PAGE HEADERS

- On the “Scheduled Processing System (SPS) Report Parameters” screen, add the Head Program. Verify that you have a Mnemonic of HEAD, a Line ID of 1000, Sequence 100 (by convention).
- On the SPS Report Code screen, code the Output. Use Format Definitions in the 1000 range. Use the SPS Format Definition screen to enter the Format Definition Commands.

- GEN.

4.CODE BREAKS

- On the “Scheduled Processing System (SPS) Report Parameters” screen, add the Break Program(s). Verify that you have a Mnemonic of BREAK, Line Definitions in the 6000 range (by convention), Sequence of 100 (by convention).
- You need a Line Definition for each Break. Use different Line Definitions (6100, 6200, 6300) for each.
- On the SPS Report Code screen, code the Break Command(s). Use Format Definitions in the corresponding 6000 range. Use the SPS Format Definition screen to enter the Format Definition Commands to format the print line.

- GEN.

• L I N K A C T I V I T Y

Add a Link activity on Process Dictionary with an activity ID matching the Data String ID of the Implosion. This activity links to program 1850, the SPS Processor. Its value is greater than 1255.

SPS Check-List

LINE DEFINITION REQUIREMENTS:

1. IMPLOSION - LINK ACTIVITY, MNEMONIC SPACES, LINE DEFINITION 0, SEQUENCE 100 _____
2. EXPLOSION - REPORT ID, MNEMONIC SPACES, LINE DEFINITION 16000, SEQUENCE 100 _____
3. OUTPUT - REPORT ID, MNEMONIC SPACES, LINE DEFINITION NOT 0 OR 16000, SEQUENCE 100 _____
4. NEW PAGE - REPORT ID, MNEMONIC HEAD, LINE DEFINITION 1000, SEQUENCE 100 _____
5. BREAK - REPORT ID, MNEMONIC BREAK, LINE DEFINITION 6000 RANGE PER BREAK LEVEL SEQUENCE 100 _____

FORMAT DEFINITION REQUIREMENTS:

1. IMPLOSION - FORMAT DEFN IN 15000-15999 RANGE _____
2. EXPLOSION - FORMAT DEFN IN 16000-16999 RANGE _____
3. OUTPUT - FORMAT DEFN EXCEPT 15000-16999 RANGE _____
4. HEAD - FORMAT DEFN 1000 RANGE (BY CONVENTION) _____
5. BREAK - FORMAT DEFN 6000 RANGE (BY CONVENTION) _____
6. REPORT CODE:
 - A. IMPLOSION CODE (LINK ACTIVITY=DATA STRING ID) _____
 - B. EXPLOSION/OUTPUT CODE (REPORT ID) _____
 - C. HEAD CODE (REPORT ID) _____
 - D. BREAK(S) CODE PER BREAK LEVEL (REPORT ID) _____

PROCESSING CONTROL ENTRY REQUIREMENTS:

1. KEY OF PASS NUMBER AND DATA STRING ID _____
2. REPORT ID FOR KEY TO SPS LINE DEFINITIONS _____
3. BEGINNING-OF-REPORT ACTIVITY(IES) _____
4. EACH-DATA-STRING ACTIVITY(IES) - (OPTIONAL) INCLUDE LINE DEFINITION _____
5. END-OF-REPORT ACTIVITY(IES) - ACTIVITY 7628 MUST BE ISSUED LAST _____

GEN REQUIREMENTS:

1. IMPLOSION DATA STRING ID/LINK ACTIVITY _____
2. REPORT ID _____

Umbrella Programming

Common SPS Errors

(OPTIONAL) VARY NUMBER OF LINES TO PRINT ON A REPORT:

FIELD ON REPORT PARAMETERS SCREEN

REGEN THE REPORT

ACTIVITY REQUIREMENT:

LINK ACTIVITY TO PROGRAM ID 1850. ACTIVITY ID MATCHES
IMPLOSION DATA STRING ID.

Notes:
